dust

CFRP / GFRP

Marine Litter

metal recycling /
fiber utilization

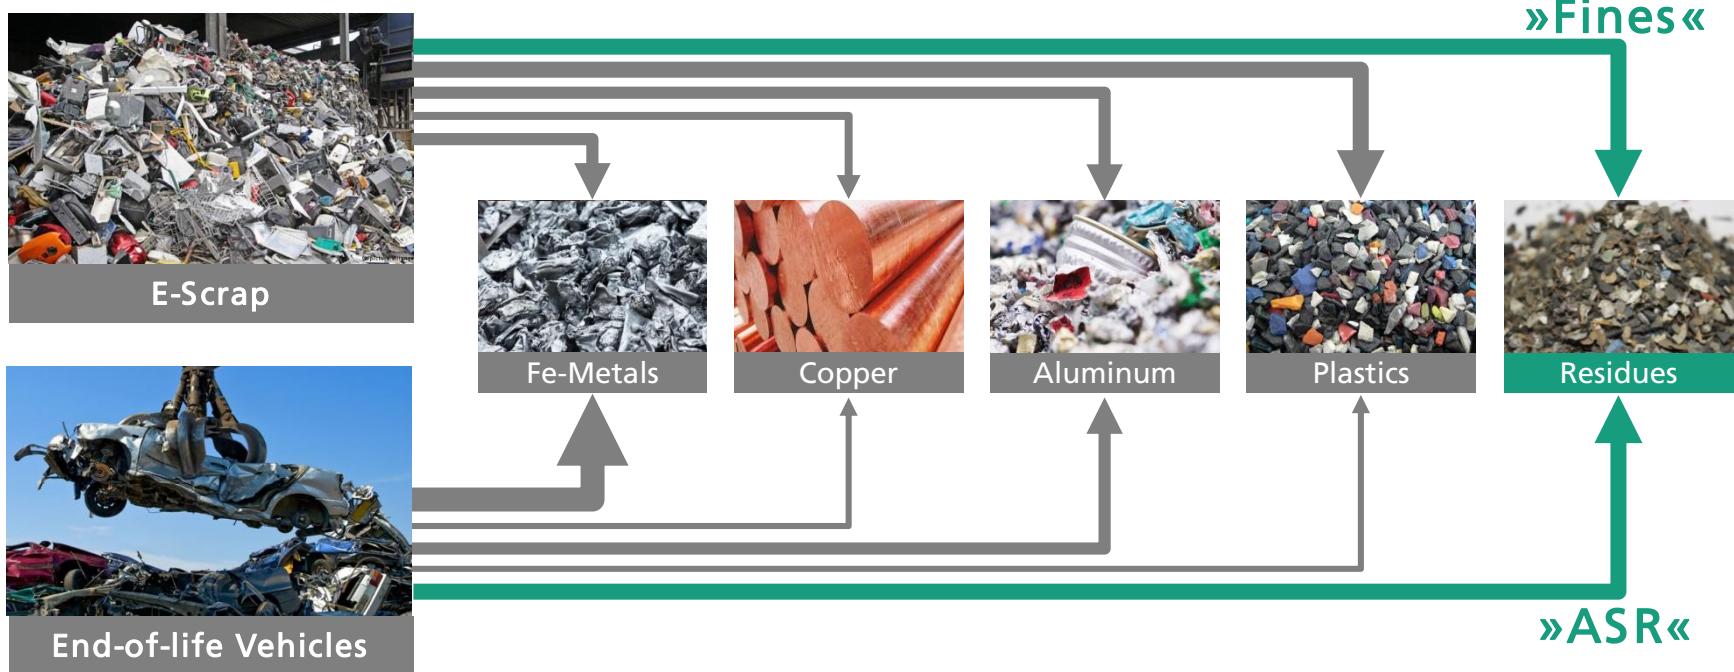

energetic utilization /
chemical recycling

*E-Scrap includes shredder residues from mechanical treatment on European standard,
ASR: Automotive Shredder Residues, CFRP / GFRP: Carbon / Glass Fiber Reinforced Plastics*

The iCycle® process

Application scenario for residues from mechanical treatment

Shredder Residues from E-Scrap

Enabling Metal Recycling using the iCycle® process

Shredder Residues
from E-Scrap

iCycle® Process

Integrated Copper
Smelters

- Accumulation of metals in a solid product
- Decomposition of plastics (low energy input)
- Safe handling of halogens
- Profitable and innovative solution

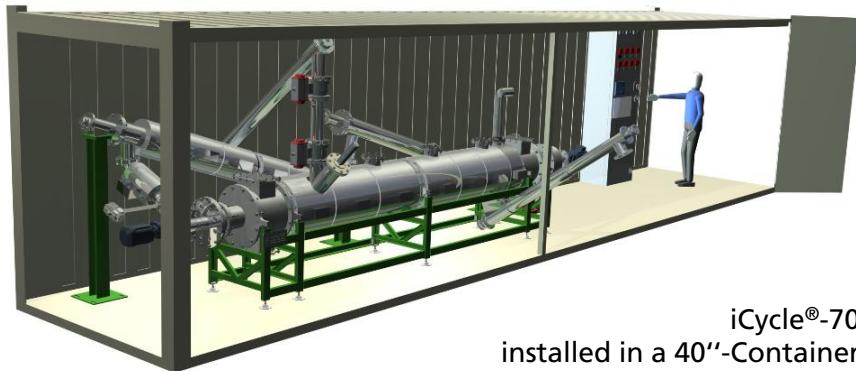

The iCycle® process for E-Scrap

Key facts

iCycle®: Key facts

- Thermo-chemical process (pyrolysis) for extraction of metals from plastics
- Main Product: Metal concentrate
- By-Products: Oil and gas for energetic utilization or feedstock recycling
- Highly profitable based on sale of metals

iCycle®-70
installed in a 40"-Container

Fields of application regarding E-Scrap

- *Formal, high-tech E-Scrap treatment (Europe):* Residual fractions from mechanical treatment
- *Informal, low-tech E-Scrap handling (Africa, Asia):* E-Scrap after small mechanical disintegration
- *Recovery of high-tech metals:* e.g. Recovery of Ta from PCB, In from LCD

The iCycle® process for E-Scrap

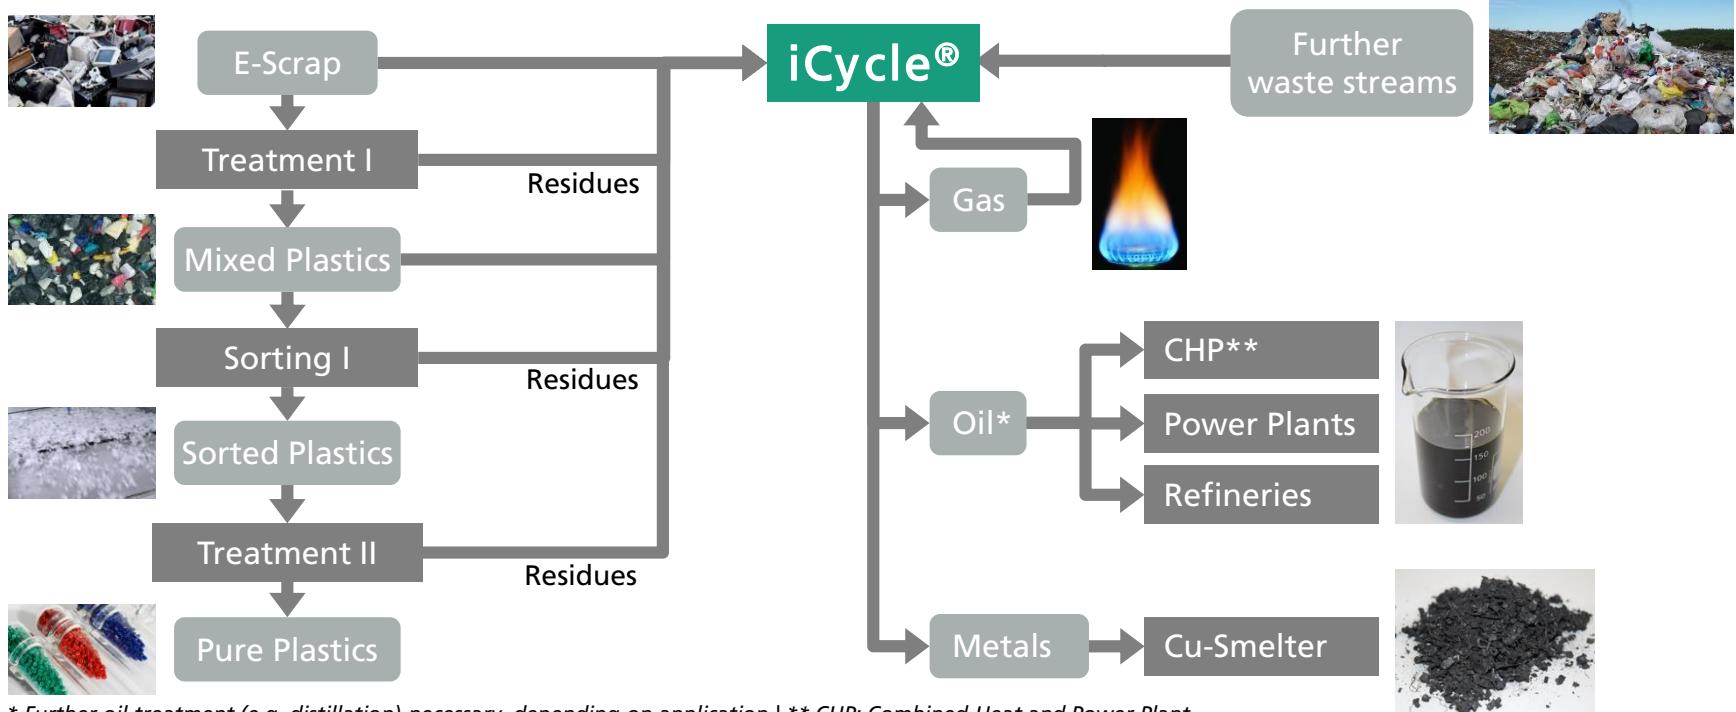

Pilot plant (70 kg/h, continuous)

iCycle® Technology

Application scenarios along the treatment chain for plastics from E-Scrap

Comparison to existing pyrolysis technologies

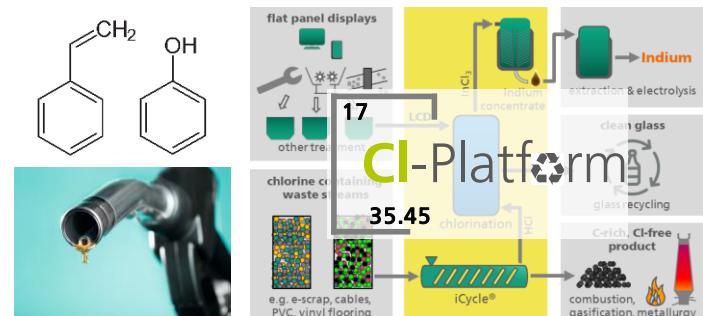

Advantages of iCycle®

Focus and technical area of iCycle®

- Wide range of feedstock with focus on metal recovery and formation of high-quality fuels
- Auger reactor for defined reaction times and prevention of fouling inside the reactor
- No limitations to halogen contents (Br, Cl)
- Products free of dioxins and furans
- Flexible scalability for a decentralized treatment

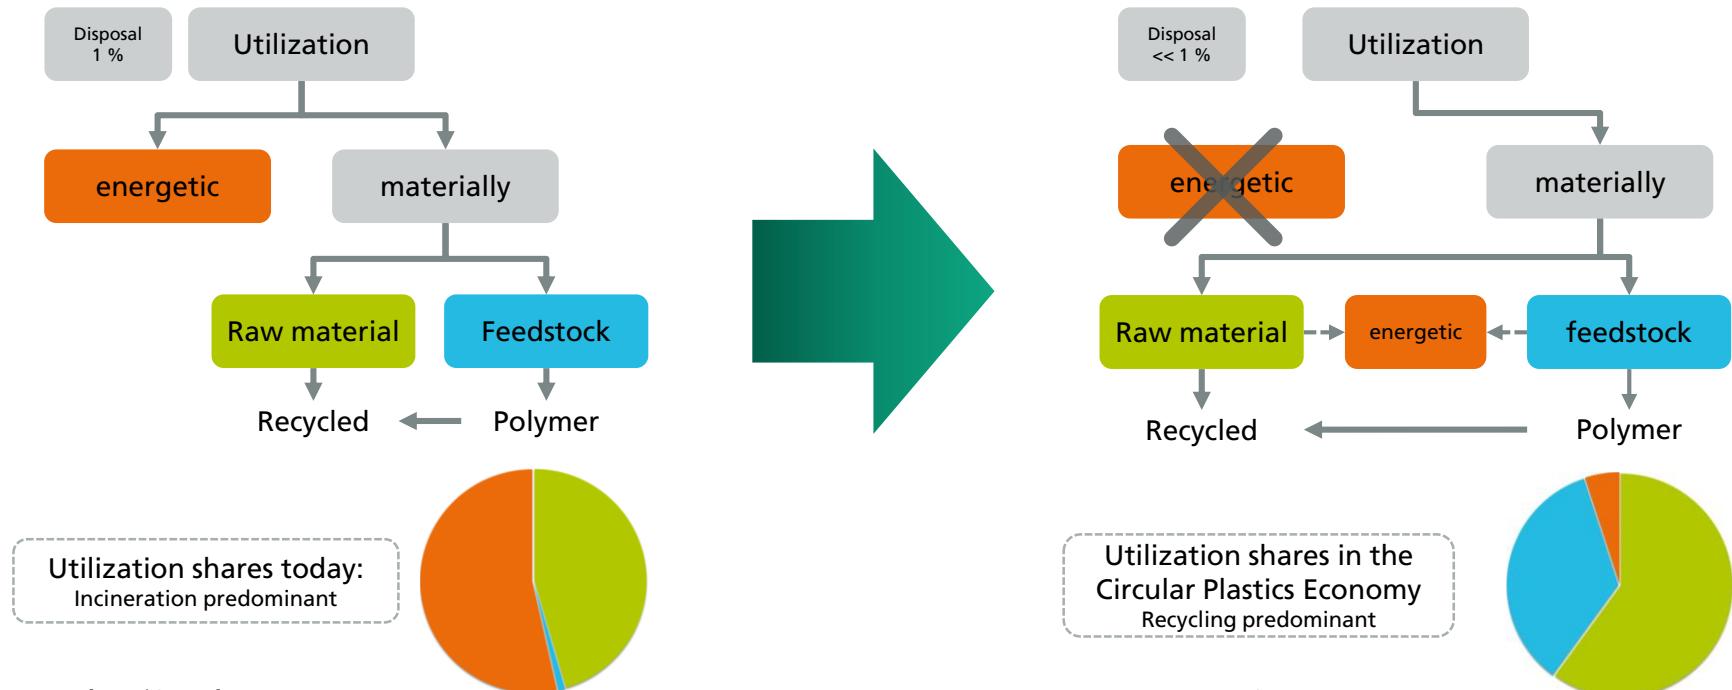

Add-ons to iCycle®

- Chlorination module for recovery of high-tech metals (e.g. In) using halogen containing waste (*Cl-Platform*)
- *CreaSolv®* process for high-quality recovery of plastics
- Recovery of aromatic compounds (e.g. phenols, styrene, BTEX)
- Molten polyolefin reactor for production of high-quality fuels

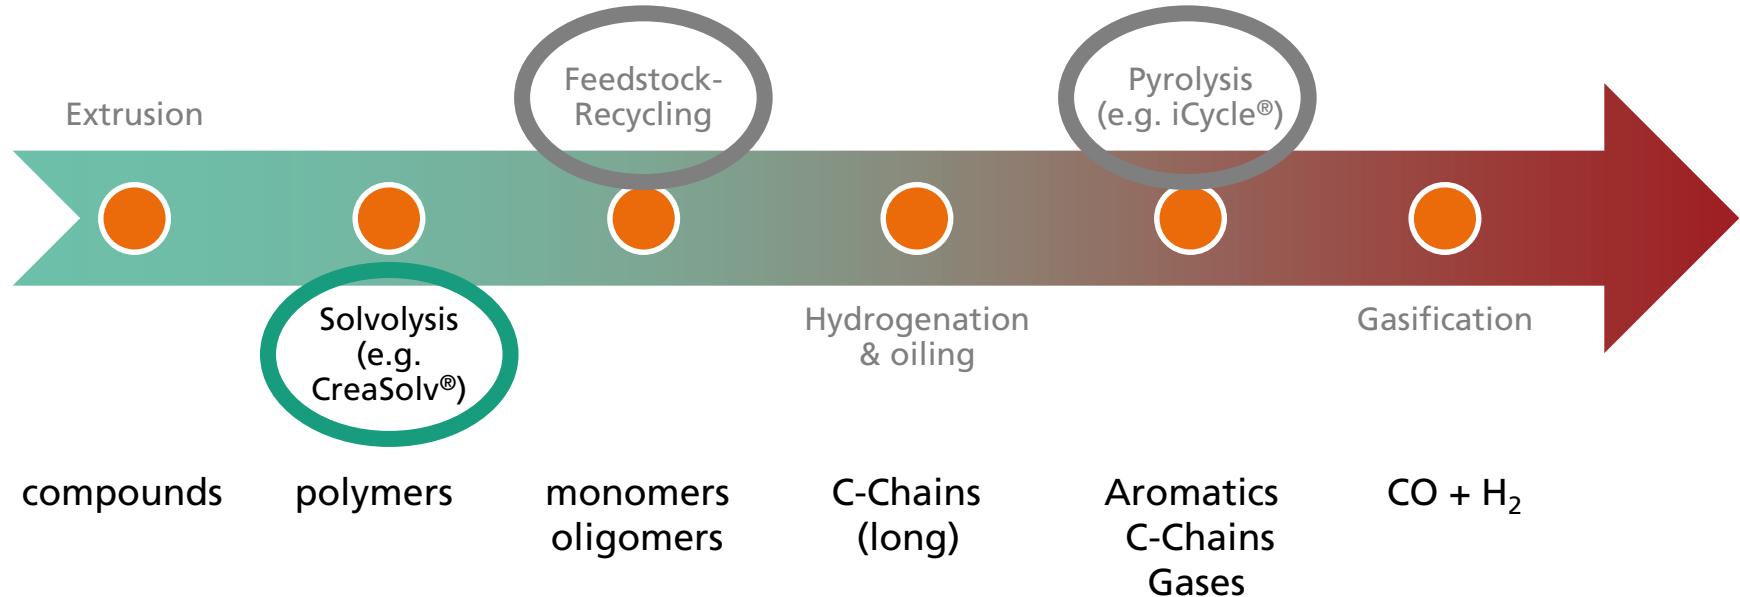

Feedstock recycling of polymers

Our vision

Feedstock recycling of polymers

Fraunhofer UMSICHT developments

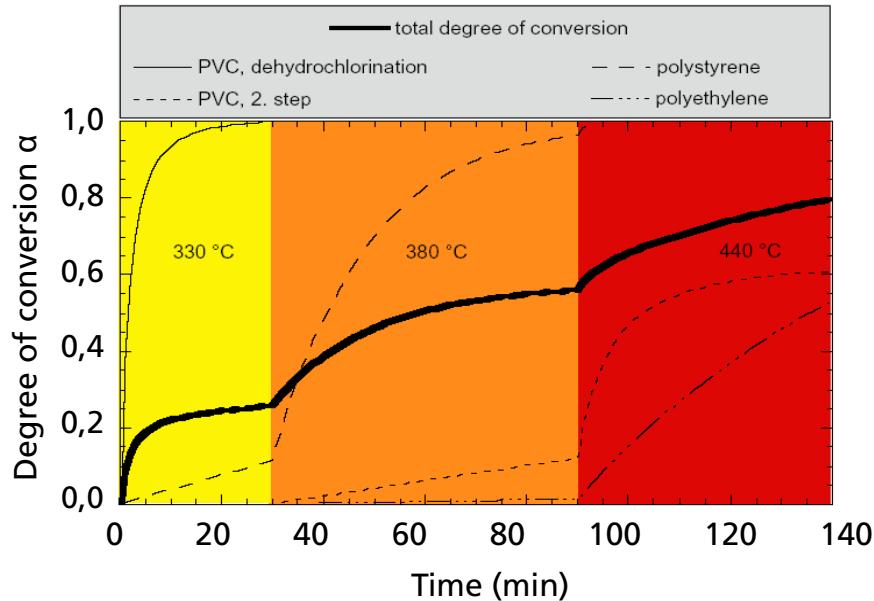

Feedstock recycling of polymers

Fraunhofer UMSICHT developments

Selective monomer recovery from complex waste plastic mixtures through stepwise degradation

- Target feedstock:
 - Waste plastic mixtures, which cannot be separated (easily)
- Selective recovery of monomers / HCl from mixtures of PVC, PA 6, PS and PE already shown
- Additionally, recovery of plastics and energy feasible (depending on feedstock)

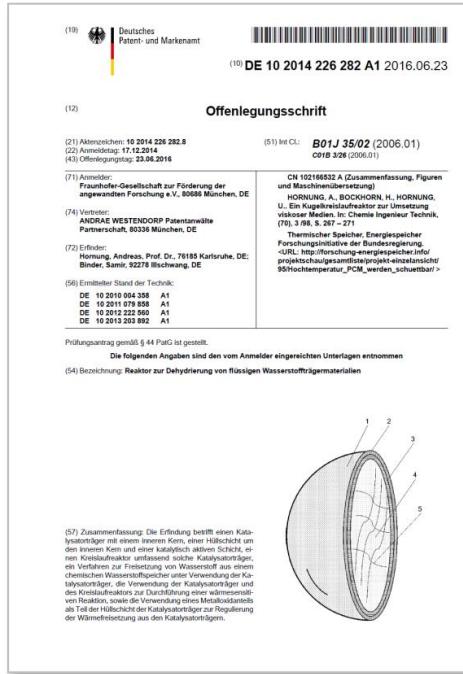

Feedstock recycling of polymers

Fraunhofer UMSICHT developments

Selective monomer recovery from complex waste plastic mixtures through stepwise degradation

- Important: reaction control and reactor design
- Fraunhofer UMSICHT designed and developed a special reactor (cycled-spheres reactor) and phase change materials
- Both enable a selective initiation of c-c bond cracking in melting reactions
