# Vorwort

Das Tätigkeitsfeld des Fraunhofer-Instituts für Techno- und Wirtschaftsmathematik ITWM umfasst anwendungsnahe Grundlagenforschung, angewandte Forschung sowie Beratung und kundenspezifische Lösungen auf allen Gebieten, die für Techno- und Wirtschaftsmathematik bedeutsam sind.

In der Reihe »Berichte des Fraunhofer ITWM« soll die Arbeit des Instituts kontinuierlich einer interessierten Öffentlichkeit in Industrie, Wirtschaft und Wissenschaft vorgestellt werden. Durch die enge Verzahnung mit dem Fachbereich Mathematik der Universität Kaiserslautern sowie durch zahlreiche Kooperationen mit internationalen Institutionen und Hochschulen in den Bereichen Ausbildung und Forschung ist ein großes Potenzial für Forschungsberichte vorhanden. In die Berichtreihe werden sowohl hervorragende Diplom- und Projektarbeiten und Dissertationen als auch Forschungsberichte der Institutsmitarbeiter und Institutsgäste zu aktuellen Fragen der Techno- und Wirtschaftsmathematik aufgenommen.

Darüber hinaus bietet die Reihe ein Forum für die Berichterstattung über die zahlreichen Kooperationsprojekte des Instituts mit Partnern aus Industrie und Wirtschaft.

Berichterstattung heißt hier Dokumentation des Transfers aktueller Ergebnisse aus mathematischer Forschungs- und Entwicklungsarbeit in industrielle Anwendungen und Softwareprodukte – und umgekehrt, denn Probleme der Praxis generieren neue interessante mathematische Fragestellungen.

## Abstract

Non-Smooth Contact Dynamics provide an increasingly popular simulation framework for granular material. In contrast to classical Discrete Element Methods, these methods are stable for arbitrary time steps. They produce visually believable results in a very short calculation time. Yet, when it comes to the prediction of draft forces they are not accurate enough. We propose to combine the method with an Interior Point algorithm for higher accuracy. Our algorithm is based on Jordan algebras. It exploits their relation to symmetric cones to tackle the conical constraints that are intrinsic to frictional contact problems. In every Interior Point Iteration a linear system has to be solved. We analyzed how the Interior Point Method behaves when it is combined with Krylov subspace solvers and incomplete factorizations. We showed that efficient preconditioners and efficient linear solvers are essential for the method to be applicable to large scale problems. Using BiCGstab as a linear solver and Incomplete Cholesky factorizations, we managed to substantially improve the accuracy in comparison to the Projected Gauß–Jacobi solver.

*Keywords:* Non-Smooth Dynamical Systems, Granular Material, Cone Complementarity Problem, Symmetric Cones, Interior Point Method, Jordan Algebra

---

## 1. Introduction

Granular material appears in numerous areas of engineering and there is an increasing demand for realistic computer simulations. Predicting the behavior of powders are of interest for toner production. Process engineering benefits from the simulation of silo discharges. The mining industry is interested in optimizing hoppers and conveyor belts, for instance. For the product design of excavators, draft forces acting on the machine from the interaction with soil is of great importance. The prediction of realistic draft forces demands the highest standards from simulation methods for granular matter. Currently, two methods are mainly used in the community, the classical Discrete Element Method (DEM) and Non-Smooth Contact Dynamics (NSCD) methods. The DEM has shown its potential to deliver draft forces that are in agreement with experimental data (Obermayr et al., 2011). But a simulation of a few seconds can take up days to weeks of calculation time. NSCD provide a class of methods that are a lot faster and more stable, but due to their low accuracy they fail to reproduce realistic draft forces. To improve the accuracy of NSCD, we propose to combine it with a specialized Interior Point Method (IPM). While being computationally more expensive than standard NSCD solvers, it does not suffer from instabilities as DEM does and it gives direct control over the trade-off between calculation time and accuracy.

In the DEM (Cundall and Strack, 1979), contact be-

tween two particles is modeled locally as a stiff spring that pushes them apart. Particles are allowed to slightly penetrate each other and a reaction force proportional to the overlap is calculated. This, together with frequent changes in contact states, limits the maximum time step size to maintain a stable simulation. Thus, the classical DEM is computationally very expensive. One way to interpret the DEM is by saying small penetrations emulate microscopic deformations. In this sense, DEM resolves the problem at much smaller time scales than those of interest. From the perspective of larger space and time scales, the granular particles seem perfectly rigid and collisions seem to be resolved instantaneously. One way of eliminating uninteresting time scales from the model is by using a non-smooth formulation for the dynamics.

In NSCD (Moreau, 1988; Moreau and Panagiotopoulos, 1990; Stewart, 2000; Acary and Brogliato, 2008), contacts and collisions between particles are modeled by inequality constraints, e.g. by demanding that the distance between two particles shall always be greater than or equal to zero. Satisfying these equations leads to absolutely continuous trajectories that need not be differentiable at every point in time. This yields a velocity and impulse based scheme, since forces no longer exist as classical functions in time. The non-smooth formulation combined with a time-stepping scheme, where the times of collision are not resolved exactly, yields a numerical method that is stable for arbitrary time step sizes.

Satisfying the inequality constraints boils down to solv-

ing a variational inequality, i.e. a complementarity problem<sup>1</sup>, at every time step of the simulation. In many applications, specifically in soil mechanical simulations, a friction model is indispensable and therefore a large Cone Complementarity Problem (CCP) has to be solved per time step (Anitescu and Potra, 1997; Anitescu and Tasora, 2008; Tasora and Anitescu, 2011).

A popular iterative solver for large scale CCPs is the Projected Gauß–Jacobi (PGJ) method, since it is easily parallelizable, it can be implemented in a matrix-free fashion and one iteration is very cheap (Tasora and Anitescu, 2011; Balzer et al., 2013). Figure 1 shows a snapshot from a simulation with one million particles, calculated using PGJ on 48 compute nodes. Its main drawback is that, after good initial convergence, its convergence rate stalls quickly if the problems are large or if large mass ratios are present. Stopping the iteration prematurely leads to artificial compliance in the granular material, incorrect angles of repose and incorrect forces (Kleinert et al., 2013). In practice, a combination of NSCD and PGJ is not necessarily more efficient than classical DEM, as a lot of PGJ iterations are necessary. Sometimes PGJ completely fails to meet the desired accuracy requirements.

A natural next step is to study second-order methods for CCPs to improve the convergence. Noteworthy contributions in this direction are (Daviet et al., 2011), where the authors employ a semi-smooth Newton method to the Fischer–Burmeister Function associated with a CCP; (Krabbenhoft et al., 2012) where the authors consider Quadratic Programming solvers and Interior Point Methods for Linear Complementarity Problems; (Heyn et al., 2013), where Krylov subspace methods are generalized for the solution of variational inequalities; and finally, the Ph.D. thesis (Heyn, 2013), which compares active-set strategies, accelerated gradient-descent methods and IPMs.

In this paper we consider a specialized IPM based on the Jordan–algebraic structure of  $\mathbb{R}^3$ . IPMs are very promising due to their good theoretical complexity bound. In practice, the required number of iterations to reach a certain accuracy stays bounded even for very large problems. Symmetric cones play an important role in Jordan algebras and hence, exploiting their structure is one way to tackle the conical constraints resulting from the Coulomb friction law.

In each iteration, a linear system of equations has to be solved. In most publications on this topic it is assumed that this system is solved directly using matrix factorizations. In large granular assemblies it is impractical to use a direct solver due to the dimension of the linear system. We favor the idea presented in (Gondzio, 2012) of using an iterative method to obtain inexact search directions in every IPM iteration, while taking precautions to maintain

good numerical properties of the linear systems.

We give a self-contained description of the Interior Point Method for NSCD. We numerically test different preconditioners and Krylov methods to solve the linear systems. We show that preconditioning is essential to make this method applicable to large scale problems. Of the tested techniques, we found that regularizing the linear systems, preconditioning with Incomplete Cholesky factorizations and solving them with the Bi-Conjugate Gradient method to be the most efficient. We show that the IPM solves the CCP to a higher accuracy than PGJ, even as the problem size increases.

In the following section, we outline the physical model and the equations of motion for the non-smooth dynamical system subject to unilateral contact and friction. Some elementary properties of symmetric cones are outlined in Section 3. The IPM is explained in detail in Section 4. Section 5 delivers numerical tests and some concluding remarks are given in Section 6.

## 2. Non-Smooth Dynamical Systems

This section is structured as follows. In Section 2.1 the equations of motion for a system of rigid bodies with non-smooth trajectories are stated. Section 2.2 introduces a simple frictionless contact model and Coulomb Friction is explained in Section 2.3. Section 2.4 provides the equations of motion in discrete time.

### 2.1. Equations of Motion

In NSCD, collisions between particles are resolved instantaneously, and thus the trajectories are not necessarily differentiable everywhere. Nevertheless, if  $\mathbf{q}(t) \in \mathbb{R}^{6m}$  is the concatenated vector containing the positions and orientations of all  $m$  particles at time  $t$ , it is an absolutely continuous function in time and hence we can write it as the anti-derivative of a velocity  $\mathbf{v}(t) \in \mathbb{R}^{6m}$ ,

$$\mathbf{q}(t) = \mathbf{q}(t_0) + \int_{t_0}^t \mathbf{v}(s) ds.$$

The velocity can have jumps and therefore is not the anti-derivate of a classical function in time. However, we can associate it to a differential measure  $d\mathbf{v}(t)$  that can be identified with the weak derivative in the distributional sense,

$$\mathbf{v}(t) = \mathbf{v}(t_0) + \int_{t_0}^t d\mathbf{v}(s).$$

The equations of motion must formally be written as a set of measure differential equations

$$M d\mathbf{v}(t) = d\mathbf{p}(t), \quad (1)$$

where  $M \in \mathbb{R}^{6m \times 6m}$  is the block-diagonal mass matrix and  $d\mathbf{p}(t)$  is the vector measure associated to the momentum of the system. If the system is only subjected to absolutely continuous external forces  $\mathbf{f}_{\text{ext}}(t) \in \mathbb{R}^{6m}$ , we can

<sup>1</sup>The complementarity problem results from the Karush–Kuhn–Tucker first order optimality conditions of an energy principle subject to inequality constraints.

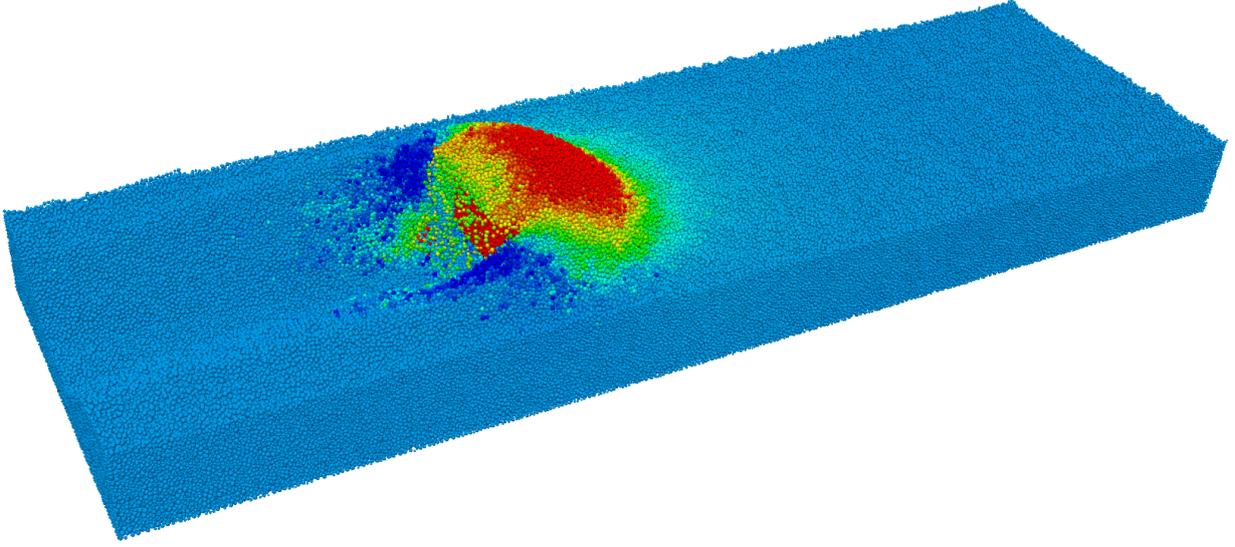

Figure 1: Snapshot from a simulation, where a rectangular blade is moved through a trench filled with one million particles. The color of the particles indicates the magnitude of their velocity.

write

$$M d\mathbf{v}(t) = d\mathbf{p}(t) = \mathbf{f}_{\text{ext}}(t)dt.$$

Due to the Lebesgue decomposition theorem (Halmos, 1950), the measure  $d\mathbf{v}(t)$  can be split into a part that has a density  $\mathbf{a}(t)$  with respect to the measure  $dt$ , a discrete measure  $\boldsymbol{\eta}(t)$ , that captures velocity jumps, and a negligible Cantor part  $\boldsymbol{\zeta}(t)$ ,

$$d\mathbf{v}(t) = \mathbf{a}(t)dt + \boldsymbol{\eta}(t) + \boldsymbol{\zeta}(t) \approx \mathbf{a}(t)dt + \boldsymbol{\eta}(t).$$

In this sense, (1) can be understood as a weak version of Newton's second law of motion (Stewart, 2000; Acary and Brogliato, 2008).

## 2.2. Unilateral Frictionless Contact

Unilateral contact means that a contact law only exerts forces in one direction to keep particles separated. Each potential contact  $i$  between two particles within the granular material is represented by an inequality constraint

$$u_i : \mathbb{R}^{6m} \rightarrow \mathbb{R}, \quad u_i(\mathbf{q}(t)) \geq 0.$$

Under the assumption that  $u_i(\mathbf{q}(t))$  is differentiable in a neighborhood of  $u_i(\mathbf{q}(t)) = 0$ , the constraint can be rewritten on the velocity level as

$$u_i(\mathbf{q}(t)) = 0 \quad \Rightarrow \quad \dot{u}_i(\mathbf{q}(t)) = \nabla u_i(\mathbf{q}(t))\mathbf{v}(t) \geq 0.$$

To each constraint we associate a reaction impulse

$$\lambda_i(t) = \int_{t_0}^t d\lambda_i(s)$$

via the complementarity condition

$$0 \leq \lambda_i(t) \perp u_i(t) \geq 0 \quad (2)$$

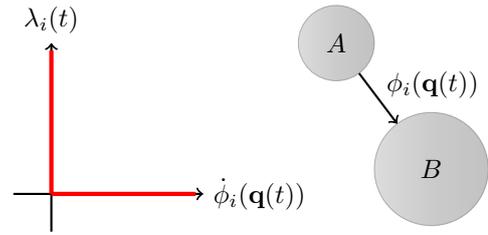

Figure 2: The Signorini Contact Condition: Either the particles are separating or a reaction impulse must be invoked.

meaning that at least one of the two non-negative values must be zero. Equation (1) turns into

$$M d\mathbf{v}(t) = \mathbf{f}_{\text{ext}}(t)dt + \sum_{\text{contacts } i} \nabla u_i(\mathbf{q}(t))^T d\lambda_i(t). \quad (3)$$

Just as for the measure  $d\mathbf{v}(t)$  associated with the velocity, the measure  $d\lambda_i(t)$  can be split into a continuous part  $\alpha_i(t)$  with respect to the Lebesgue measure  $dt$  and a discrete part  $\xi_i(t)$ ,

$$d\lambda_i = \alpha_i(t)dt + \xi_i(t).$$

The discrete part resolves collisions and percussions, while the continuous part captures reaction forces from smooth parts of the motion, such as persistent contact in static assemblies of granular materials.

Consider a contact with index  $i$  associated to two particles in the system indexed by  $A$  and  $B$ . Let  $\phi_i(\mathbf{q}(t))$  be the signed distance between the two particles. If  $\phi_i(\mathbf{q}(t))$  is zero and  $\lambda_i$  is the reaction impulse in normal direction of the contact, the complementarity condition (2) on velocity level amounts to

$$0 \leq u_i(\mathbf{q}(t)) = \dot{\phi}_i(\mathbf{q}(t)) \perp \lambda_i \geq 0, \quad (4)$$

see Figure 2. Either two particles are separating and no reaction impulse is needed, or a reaction impulse must be enforced that keeps them from penetrating. This formulation corresponds to a completely inelastic collision.

Let  $\mathbf{n}_i(t) \in \mathbb{R}^3$  be the contact normal pointing from body  $A$  to body  $B$  and let  $\mathbf{r}_A(t)$  and  $\mathbf{r}_B(t) \in \mathbb{R}^3$  be the vectors pointing from the centers of mass to the contact points on bodies  $A$  and  $B$  respectively. With

$$\mathbf{v}(t) = \begin{bmatrix} \mathbf{v}_1(t) \\ \vdots \\ \mathbf{v}_m(t) \end{bmatrix} \in \mathbb{R}^{6m}, \quad \mathbf{v}_k(t) = \begin{bmatrix} \boldsymbol{\nu}_k(t) \\ \boldsymbol{\omega}_k(t) \end{bmatrix} \in \mathbb{R}^6$$

where  $\boldsymbol{\nu}_k(t)$  is the translational velocity of the  $k$ -th particle and  $\boldsymbol{\omega}_k(t)$  its angular velocity, it holds

$$D_{\mathbf{in}}(t) := \nabla u_i(\mathbf{q}(t))^T = \begin{bmatrix} 0 \\ \vdots \\ 0 \\ -\mathbf{n}_i(t) \\ -\mathbf{r}_A(t) \times \mathbf{n}_i(t) \\ 0 \\ \vdots \\ 0 \\ \mathbf{n}_i(t) \\ \mathbf{r}_B(t) \times \mathbf{n}_i(t) \\ 0 \\ \vdots \\ 0 \end{bmatrix}.$$

Let there be  $n$  contacts at time  $t$ . By writing

$$D(t) := [D_{\mathbf{1n}}(t), \dots, D_{\mathbf{nn}}(t)] \in \mathbb{R}^{6m \times n}$$

and

$$\boldsymbol{\lambda} := \begin{bmatrix} \lambda_1 \\ \vdots \\ \lambda_n \end{bmatrix} \in \mathbb{R}^n, \quad \mathbf{u} := \begin{bmatrix} u_1 \\ \vdots \\ u_n \end{bmatrix} \in \mathbb{R}^n$$

the equations of motion (3) together with the complementarity condition (4) are given by

$$\begin{aligned} \mathbf{q}(t) &= \mathbf{q}(t_0) + \int_{t_0}^t \mathbf{v}(s) ds, \\ \mathbf{v}(t) &= \mathbf{v}(t_0) + \int_{t_0}^t d\mathbf{v}(s), \\ M d\mathbf{v}(t) &= \mathbf{f}_{\text{ext}}(t) dt + D(t) d\boldsymbol{\lambda}(t) \end{aligned}$$

$$\mathbf{0} \leq \mathbf{u} \perp \boldsymbol{\lambda} \geq 0,$$

where the inequality has to be understood componentwise.

### 2.3. Coulomb Friction

The Coulomb friction model relates the tangential reaction impulse  $\boldsymbol{\lambda}_{\mathbf{it}} \in \mathbb{R}^2$  of a contact in the granular system to the normal reaction impulse  $\lambda_{\mathbf{in}}$  via the restriction  $\|\boldsymbol{\lambda}_{\mathbf{it}}\| \leq \mu_i \lambda_{\mathbf{in}}$ , where  $\mu_i$  is the frictional coefficient. The maximum dissipation principle reformulates this concept as an optimization problem (Stewart, 2000). It states that  $\boldsymbol{\lambda}_{\mathbf{it}}$  and the relative tangential velocity  $\mathbf{v}_{\mathbf{it},\text{rel}}$  in the

contact are anti-parallel, and friction maximizes the energy dissipation from the system subject to the constraint  $\|\boldsymbol{\lambda}_{\mathbf{it}}\| \leq \mu_i \lambda_{\mathbf{in}}$ .

In accordance with (DeSaxcé and Feng, 1998), we cast the complementarity condition (4) for the normal reaction impulse together with the maximum dissipation principle into a Cone Complementarity Problem (CCP) of the form

$$K_{\mu_i} \ni \boldsymbol{\lambda}_i = \begin{bmatrix} \lambda_{\mathbf{in}} \\ \boldsymbol{\lambda}_{\mathbf{it}} \end{bmatrix} \perp \mathbf{u}_i = \begin{bmatrix} u_{\mathbf{in}} \\ \mathbf{u}_{\mathbf{it}} \end{bmatrix} \in K_{\mu_i}^* \quad (5)$$

where

$$\mathbf{u}_i = \begin{bmatrix} \dot{\phi}_i(\mathbf{q}(t)) + \mu_i \|\mathbf{v}_{\mathbf{it},\text{rel}}\| \\ \mathbf{v}_{\mathbf{it},\text{rel}} \end{bmatrix} \in \mathbb{R}^3. \quad (6)$$

Figure 3 depicts an example of the CCP associated to a brick sliding down an inclined slope. The cone

$$K_{\mu_i} := \left\{ \begin{bmatrix} \lambda_{\mathbf{n}} \\ \boldsymbol{\lambda}_{\mathbf{t}} \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^2 \mid \mu_i \lambda_{\mathbf{n}} \geq \|\boldsymbol{\lambda}_{\mathbf{t}}\| \right\}$$

is called the Coulomb Friction Cone and its dual cone is given by

$$\begin{aligned} K_{\mu_i}^* &:= \left\{ \mathbf{u} \in \mathbb{R}^3 \mid \mathbf{u}^T \boldsymbol{\lambda} \geq 0 \text{ for all } \boldsymbol{\lambda} \in K_{\mu_i} \right\} \\ &= \left\{ \begin{bmatrix} u_{\mathbf{n}} \\ \mathbf{u}_{\mathbf{t}} \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^2 \mid u_{\mathbf{n}} \geq \mu_i \|\mathbf{u}_{\mathbf{t}}\| \right\}. \end{aligned}$$

For the contact with index  $i$ , let  $\mathbf{t}_{i1}(t)$  and  $\mathbf{t}_{i2}(t)$  span the contact plane and let

$$D_i(t) = [D_{\mathbf{in}}(t) \quad D_{\mathbf{it}}(t)] \in \mathbb{R}^{6m \times 3}$$

be the constraint Jacobian as described in (Anitescu et al., 1995; Tasora and Anitescu, 2011), where  $D_{\mathbf{it}}(t) \in \mathbb{R}^{6m \times 2}$  is given by

$$D_{\mathbf{it}}(t) := \begin{bmatrix} 0 & 0 \\ \vdots & \vdots \\ 0 & 0 \\ -\mathbf{t}_{i1}(t) & -\mathbf{t}_{i2}(t) \\ -\mathbf{r}_A(t) \times \mathbf{t}_{i1}(t) & -\mathbf{r}_A(t) \times \mathbf{t}_{i2}(t) \\ 0 & 0 \\ \vdots & \vdots \\ 0 & 0 \\ \mathbf{t}_{i1}(t) & \mathbf{t}_{i2}(t) \\ \mathbf{r}_B(t) \times \mathbf{t}_{i1}(t) & \mathbf{r}_B(t) \times \mathbf{t}_{i2}(t) \\ 0 & 0 \\ \vdots & \vdots \\ 0 & 0 \end{bmatrix}.$$

Then we can write (6) as

$$\mathbf{u}_i = D_i(t)^T \mathbf{v}(t) + \mu_i \begin{bmatrix} \|D_{\mathbf{it}}(t)^T \mathbf{v}(t)\| \\ 0 \\ 0 \end{bmatrix} \in \mathbb{R}^3. \quad (7)$$

With

$$D(t) := [D_1(t), \dots, D_n(t)] \in \mathbb{R}^{6m \times 3n}$$

and

$$\boldsymbol{\lambda} := \begin{bmatrix} \lambda_1 \\ \vdots \\ \lambda_n \end{bmatrix} \in \mathbb{R}^{3n}, \quad \mathbf{u} := \begin{bmatrix} \mathbf{u}_1 \\ \vdots \\ \mathbf{u}_n \end{bmatrix} \in \mathbb{R}^{3n}$$

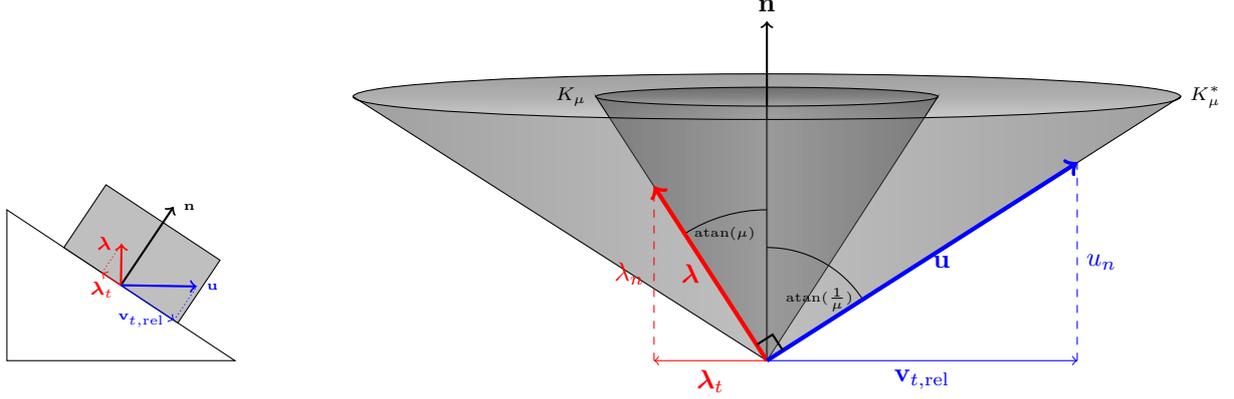

Figure 3: The Cone Complementarity Problem of a contact in sliding mode: Both  $\lambda$  and  $\mathbf{u}$  are non-zero, and thus they have to be on the boundary of their respective cones to fulfill the complementarity condition.

the equations of motion (3) together with the complementarity condition (5) are given by

$$\begin{aligned} \mathbf{q}(t) &= \mathbf{q}(t_0) + \int_{t_0}^t \mathbf{v}(s) ds, \\ \mathbf{v}(t) &= \mathbf{v}(t_0) + \int_{t_0}^t d\mathbf{v}(s), \\ M d\mathbf{v}(t) &= \mathbf{f}_{\text{ext}}(t) dt + D(t) d\lambda(t) \end{aligned} \quad (8)$$

$$\mathcal{K}_\mu^* \ni \mathbf{u} \perp \lambda \in \mathcal{K}_\mu,$$

where

$$\mathcal{K}_\mu := K_{\mu_1} \times \dots \times K_{\mu_n}$$

and

$$\mathcal{K}_\mu^* = K_{\mu_1}^* \times \dots \times K_{\mu_n}^*.$$

#### 2.4. Time Discretization

In the application of simulating granular material, first order integration methods suffice. In contrast to the classical DEM, we do not require higher order methods to maintain a stable simulation. Due to the non-smoothness of the trajectories, one can only expect first order accuracy in time steps that contain a non-smooth event such as an impact. Thus, given positions  $\mathbf{q}(t_j)$ , velocities  $\mathbf{v}(t_j)$  and external forces  $\mathbf{f}_{\text{ext}}(t_j)$  at a time step  $t_j$ , we calculate positions at  $t_{j+1} = t_j + \Delta t$  using an implicit Euler scheme,

$$\mathbf{q}(t_{j+1}) = \mathbf{q}(t_j) + \Delta t \mathbf{v}(t_{j+1}).$$

Under the assumption that  $D(t)$  and  $\mathbf{f}_{\text{ext}}(t)$  are approximately constant within one time step  $[t_j, t_{j+1}]$ , we can discretize equation (8) via

$$\mathbf{v}(t_{j+1}) = \mathbf{v}(t_j) + \Delta t M^{-1} \mathbf{f}_{\text{ext}}(t_j) + M^{-1} D \lambda, \quad (9)$$

where  $D = D(t_j)$ .

In the spirit of time-stepping schemes, we want to satisfy the inequality constraints  $u_i(\mathbf{q}(t)) \geq 0$ ,  $i = 1, \dots, n$

only at the boundaries of the intervals  $[t_j, t_{j+1}]$ . We do not resolve the exact times of impacts and the reaction impulse

$$\lambda = \int_{t_j}^{t_{j+1}} d\lambda$$

captures all smooth and non-smooth interactions within the time step  $[t_j, t_{j+1}]$ .

One way of satisfying the constraint  $\phi_i(\mathbf{q}(t_{j+1})) \geq 0$  on the velocity level is by demanding

$$\dot{\phi}_i(\mathbf{q}(t_{j+1})) \geq 0$$

for all body pairs with  $\phi_i(\mathbf{q}(t_j)) \leq 0$ . This is numerically not stable, as initial penetrations increase with time. A better choice is to check for potential contacts in the time interval  $[t_j, t_{j+1}]$  at time  $t_j$  and requiring

$$\dot{\phi}_i(\mathbf{q}(t_{j+1})) = \nabla \phi_i(\mathbf{q}(t_{j+1}))^T \mathbf{v}(t_{j+1}) \geq -\frac{\phi_i(\mathbf{q}(t_j))}{\Delta t},$$

i.e. the relative normal velocity has to be larger than the negative constant velocity needed to close the gap between the particles by the time  $t_{j+1}$ . This is equivalent to the constraint

$$\begin{aligned} \phi_i(\mathbf{q}(t_{j+1})) &= \phi_i(\mathbf{q}(t_j) + \Delta t \mathbf{v}(t_{j+1})) \\ &\approx \phi_i(\mathbf{q}(t_j)) + \Delta t \nabla \phi_i(\mathbf{q}(t_{j+1}))^T \mathbf{v}(t_{j+1}) \geq 0. \end{aligned}$$

With this stabilization and (9), Equation (7) becomes

$$\begin{aligned} \mathbf{u}_i &= D_i^T \mathbf{v}(t_{j+1}) + \begin{bmatrix} \frac{\phi_i(\mathbf{q}(t_j))}{\Delta t} \\ 0 \\ 0 \end{bmatrix} + \mu_i \begin{bmatrix} \|D_{it}^T \mathbf{v}(t_{j+1})\| \\ 0 \\ 0 \end{bmatrix} \\ &= D_i^T M^{-1} D \lambda + \bar{\mathbf{r}}_i + \tilde{\mathbf{r}}_i(\lambda). \end{aligned}$$

where

$$\bar{\mathbf{r}}_i = D_i^T (\mathbf{v}(t_j) + \Delta t M^{-1} \mathbf{f}_{\text{ext}}(t_j)) + \begin{bmatrix} \frac{\phi_i(\mathbf{q}(t_j))}{\Delta t} \\ 0 \\ 0 \end{bmatrix} \quad (10)$$

and

$$\begin{aligned} \tilde{\mathbf{r}}_i(\boldsymbol{\lambda}) &= \mu_i \begin{bmatrix} \|D_{it}^T \mathbf{v}(t_{j+1})\| \\ 0 \\ 0 \end{bmatrix} \\ &= \begin{bmatrix} \mu_i \|D_{it}^T M^{-1} D \boldsymbol{\lambda} + D_{it}^T (\mathbf{v}(t_j) + \Delta t M^{-1} \mathbf{f}_{\text{ext}}(t_j))\| \\ 0 \\ 0 \end{bmatrix}. \end{aligned}$$

Finally, by writing

$$\bar{N} = D^T M^{-1} D \in \mathbb{R}^{3n \times 3n}, \quad (11)$$

$$\bar{\mathbf{r}} := \begin{bmatrix} \bar{\mathbf{r}}_1 \\ \vdots \\ \bar{\mathbf{r}}_n \end{bmatrix}, \tilde{\mathbf{r}}(\boldsymbol{\lambda}) := \begin{bmatrix} \tilde{\mathbf{r}}_1(\boldsymbol{\lambda}) \\ \vdots \\ \tilde{\mathbf{r}}_n(\boldsymbol{\lambda}) \end{bmatrix} \in \mathbb{R}^{3n}$$

we obtain

$$\mathbf{u} = \bar{F}(\boldsymbol{\lambda}) = \bar{N} \boldsymbol{\lambda} + \bar{\mathbf{r}} + \tilde{\mathbf{r}}(\boldsymbol{\lambda})$$

with a positive semi-definite matrix  $\bar{N}$ .

The equations that have to be satisfied in every time step of a simulation are

$$\begin{aligned} \mathbf{q}(t_{j+1}) &= \mathbf{q}(t_j) + \Delta t \mathbf{v}(t_{j+1}), \\ \mathbf{v}(t_{j+1}) &= \mathbf{v}(t_j) + \Delta t M^{-1} \mathbf{f}_{\text{ext}}(t_j) + M^{-1} D \boldsymbol{\lambda}, \\ \mathcal{K}_\mu \ni \boldsymbol{\lambda} \perp \mathbf{u} = \bar{F}(\boldsymbol{\lambda}) &\in \mathcal{K}_\mu^*. \end{aligned} \quad (12)$$

Almost the entire computational effort for a time step is spent on solving (12). Note, that without the term  $\tilde{\mathbf{r}}(\boldsymbol{\lambda})$ ,  $\bar{F}$  would be a linear function in  $\boldsymbol{\lambda}$  and (12) would be equivalent to a quadratic minimization problem subject to conical constraints. The term  $\tilde{\mathbf{r}}(\boldsymbol{\lambda})$  complicates numerical methods that make use of the gradient of  $\bar{F}(\boldsymbol{\lambda})$ , because  $\bar{F}$  is not differentiable if the relative contact velocity is zero. Thus we have to make use of the generalized Jacobian

$$\begin{aligned} \partial \bar{F}(\boldsymbol{\lambda}) &= \bar{N} + \partial \tilde{\mathbf{r}}(\boldsymbol{\lambda}) \\ &= \bar{N} + \begin{bmatrix} \partial \tilde{\mathbf{r}}_1(\boldsymbol{\lambda}) \\ \vdots \\ \partial \tilde{\mathbf{r}}_n(\boldsymbol{\lambda}) \end{bmatrix} \end{aligned} \quad (13)$$

with

$$\partial \tilde{\mathbf{r}}_i(\boldsymbol{\lambda}) = \begin{bmatrix} \frac{\mu_i}{\|D_{it}^T \mathbf{v}(t_{j+1})\|} \mathbf{v}(t_{j+1})^T D_{it} D_{it}^T M^{-1} D \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} \in \mathbb{R}^{3 \times 3n}$$

if  $D_{it}^T \mathbf{v}(t_{j+1}) \neq \mathbf{0}$ ; and

$$\partial \tilde{\mathbf{r}}_i(\boldsymbol{\lambda}) = \left\{ \begin{bmatrix} \frac{\mu_i}{\|\boldsymbol{\xi}_i\|} \boldsymbol{\xi}_i^T D_{it}^T M^{-1} D \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} \in \mathbb{R}^{3 \times 3n} \mid \boldsymbol{\xi}_i \in \mathbb{R}^2 \right\}$$

if  $D_{it}^T \mathbf{v}(t_{j+1}) = \mathbf{0}$ . The gradient  $\nabla \bar{F}(\boldsymbol{\lambda})$  would be constant if it wasn't for the term  $\tilde{\mathbf{r}}(\boldsymbol{\lambda})$  and would not need to be re-evaluated whenever  $\boldsymbol{\lambda}$  changes. In addition,  $\nabla \bar{F}(\boldsymbol{\lambda})$  would be symmetric.

Fortunately,  $\mu_i$  and  $D_{it}^T \mathbf{v}(t)$  are usually fairly small in the context of granular material, and ignoring  $\tilde{\mathbf{r}}(\boldsymbol{\lambda})$  is a valid approximation in a wide range of applications (Anitescu, 2005).

### 3. Symmetric Cones

The Interior Point Method for the solution of (12) proposed in this paper makes use of the Jordan–algebraic structure defined on  $\mathbb{R}^N$ , which is directly related to a self-dual cone  $C = C^*$ . This section gives a definition of cones and dual cones and we revise the most important properties of Jordan algebras and symmetric cones needed in Section 4.

A proper cone  $K \in \mathbb{R}^N$  is a closed, non-empty set, such that

- it is closed with respect to positive linear combinations, i.e. for  $\mathbf{x}, \mathbf{y} \in K$  and  $\alpha, \beta \geq 0$  it holds

$$\alpha \mathbf{x} + \beta \mathbf{y} \in K,$$

- it does not contain a linear space, i.e.

$$\mathbf{x} \in K \text{ and } -\mathbf{x} \in K \Rightarrow \mathbf{x} = \mathbf{0}.$$

For a proper cone  $K$  we define the dual cone as

$$K^* := \{ \mathbf{y} \in \mathbb{R}^N \mid \mathbf{x}^T \mathbf{y} \geq 0 \text{ for all } \mathbf{x} \in K \}.$$

$K^*$  is also a proper cone.

A real Jordan algebra is a vector space  $A$  with a vector product (or Jordan product)

$$\circ : A \times A \rightarrow A$$

satisfying the properties

$$\begin{aligned} \mathbf{x} \circ \mathbf{y} &= \mathbf{y} \circ \mathbf{x} && (\text{commutativity}) \\ (\mathbf{x} \circ \mathbf{x}) \circ (\mathbf{x} \circ \mathbf{y}) &= \mathbf{x} \circ (\mathbf{x} \circ (\mathbf{x} \circ \mathbf{y})) && (\text{power associativity}) \end{aligned}$$

for all  $\mathbf{x}, \mathbf{y} \in A$ . The symmetric cone  $C$  in  $A$  is the set of squares with respect to the Jordan product,

$$C := \{ \mathbf{x} \circ \mathbf{x} \mid \mathbf{x} \in A \}.$$

There are several examples of Jordan algebras and the Interior Point algorithm presented here can be seen as a generic solver for any Cone Complementarity Problem with a symmetric cone<sup>2</sup>. In this paper however, we are concerned specifically with the space  $A = \mathbb{R}^N$  for some  $N \geq 1$  together with the Jordan Product

$$\mathbf{x} \circ \mathbf{y} = \frac{1}{\sqrt{2}} \begin{bmatrix} \mathbf{x}^T \mathbf{y} \\ x_n \mathbf{y}_t + y_n \mathbf{x}_t \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^{N-1}$$

for all

$$\mathbf{x} = \begin{bmatrix} x_n \\ \mathbf{x}_t \end{bmatrix}, \mathbf{y} = \begin{bmatrix} y_n \\ \mathbf{y}_t \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^{N-1}.$$

<sup>2</sup>Important examples of symmetric cones are the cone of positive semi-definite matrices or the positive orthant  $\mathbb{R}_+^N$ .

The symmetric cone in  $(\mathbb{R}^N, \circ)$  is

$$C := \left\{ \mathbf{x} \circ \mathbf{x} \mid \mathbf{x} \in A \right\} \\ = \left\{ \begin{bmatrix} x_{\mathbf{n}} \\ \mathbf{x}_{\mathbf{t}} \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^{N-1} \mid x_{\mathbf{n}} \geq \|\mathbf{x}_{\mathbf{t}}\| \right\}. \quad (14)$$

In the following, we revise the essential properties of the Jordan algebra  $(\mathbb{R}^N, \circ)$  needed to derive the IPM. The results from this section are taken from (Faraut and Korányi, 1994; Faybusovich, 2002; Fukushima et al., 2002; Alizadeh and Goldfarb, 2003; Bai et al., 2004; Hayashi, 2004).

(a)  $C$  is self-dual, i.e.  $C = C^*$  and thus  $\mathbf{x}^T \mathbf{y} \geq 0$  for all  $\mathbf{x}, \mathbf{y} \in C$ .

(b) The unit element

$$\mathbf{e} = \begin{bmatrix} \sqrt{2} \\ \mathbf{0} \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^{N-1}$$

satisfies  $\mathbf{x} \circ \mathbf{e} = \mathbf{x}$  for all  $\mathbf{x} \in \mathbb{R}^N$ .

(c) Every  $\mathbf{x} \in \mathbb{R}^N$  can be written as

$$\mathbf{x} = \lambda_1 \mathbf{q}_1 + \lambda_2 \mathbf{q}_2$$

with spectral values

$$\lambda_1 := \frac{1}{\sqrt{2}} (x_{\mathbf{n}} - \|\mathbf{x}_{\mathbf{t}}\|) \quad \text{and} \quad \lambda_2 := \frac{1}{\sqrt{2}} (x_{\mathbf{n}} + \|\mathbf{x}_{\mathbf{t}}\|)$$

and spectral vectors

$$\mathbf{q}_1 := \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ -\frac{\mathbf{x}_{\mathbf{t}}}{\|\mathbf{x}_{\mathbf{t}}\|} \end{bmatrix} \quad \text{and} \quad \mathbf{q}_2 := \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ +\frac{\mathbf{x}_{\mathbf{t}}}{\|\mathbf{x}_{\mathbf{t}}\|} \end{bmatrix}.$$

The spectral vectors are an orthonormal coordinate system of the plane spanned by  $\mathbf{e}$  and  $\mathbf{x}$ . If  $\mathbf{x}_{\mathbf{t}}$  is zero, the term  $\mathbf{x}_{\mathbf{t}}/\|\mathbf{x}_{\mathbf{t}}\|$  in the definition of  $\mathbf{q}_1$  and  $\mathbf{q}_2$  can be replaced with any vector of unit length in  $\mathbb{R}^{N-1}$ .

It holds  $\mathbf{q}_1 + \mathbf{q}_2 = \mathbf{e}$ ;  $\mathbf{x} \in C$  if and only if  $\lambda_1, \lambda_2 \geq 0$ ; and  $\mathbf{x} \in \text{int } C$ , if and only if  $\lambda_1, \lambda_2 > 0$ .

(d) The trace of a vector  $\mathbf{x} \in \mathbb{R}^N$  is defined by

$$\text{tr}(\mathbf{x}) := \lambda_1 + \lambda_2 = \sqrt{2} x_{\mathbf{n}}$$

and the determinant is

$$\det(\mathbf{x}) := \lambda_1 \cdot \lambda_2 = \frac{1}{2} (x_{\mathbf{n}}^2 - \|\mathbf{x}_{\mathbf{t}}\|^2).$$

(e)  $J = \begin{bmatrix} 1 & \mathbf{0} \\ \mathbf{0} & -I_{N-1} \end{bmatrix} \in \mathbb{R}^{N \times N}$  is called the reflection matrix, where  $I_{N-1}$  denotes the unit matrix in  $\mathbb{R}^{N-1}$ . A vector  $\mathbf{x} \in \mathbb{R}^N$  is said to be invertible, if  $\det(\mathbf{x}) \neq 0$  and its inverse is given by

$$\mathbf{x}^{-1} = \frac{1}{\det(\mathbf{x})} J \mathbf{x}.$$

It holds  $\mathbf{x}^{-1} \circ \mathbf{x} = \mathbf{e}$  for all invertible  $\mathbf{x} \in \mathbb{R}^N$ .

(f) For any function  $\psi : \mathbb{R} \rightarrow \mathbb{R}$  we define

$$\psi(\mathbf{x}) := \psi(\lambda_1) \mathbf{q}_1 + \psi(\lambda_2) \mathbf{q}_2$$

for  $\mathbf{x} \in \mathbb{R}^N$ . More specifically, for any  $\alpha \in \mathbb{R}$  we can define

$$\mathbf{x}^\alpha = \lambda_1^\alpha \mathbf{q}_1 + \lambda_2^\alpha \mathbf{q}_2,$$

if  $\lambda_1^\alpha, \lambda_2^\alpha$  exist.

(g) For  $\mathbf{x}, \mathbf{y} \in \mathbb{R}^N$ , the function  $g(\mathbf{x}, \mathbf{y}) = \mathbf{x} \circ \mathbf{y}$  is bilinear and it holds

$$\mathbf{x} \circ \mathbf{y} = L(\mathbf{x}) \cdot \mathbf{y}$$

where  $L(x)$  is the arrowhead matrix

$$L(x) = \nabla_{\mathbf{y}} g(\mathbf{x}, \mathbf{y}) = \frac{1}{\sqrt{2}} \begin{bmatrix} x_{\mathbf{n}} & \mathbf{x}_{\mathbf{t}}^T \\ \mathbf{x}_{\mathbf{t}} & I_{N-1} x_{\mathbf{n}} \end{bmatrix}.$$

The eigenvalues of  $L(\mathbf{x})$  are

$$\lambda_1 = \frac{1}{\sqrt{2}} (x_{\mathbf{n}} - \|\mathbf{x}_{\mathbf{t}}\|), \\ \lambda_2 = \frac{1}{\sqrt{2}} (x_{\mathbf{n}} + \|\mathbf{x}_{\mathbf{t}}\|), \\ \lambda_k = \sqrt{2} x_{\mathbf{n}} \quad \text{for } k = 3, \dots, N.$$

(h) The matrix

$$P(\mathbf{x}) := 2L(\mathbf{x})^2 - L(\mathbf{x}^2).$$

is called the quadratic representation of  $\mathbf{x} \in \mathbb{R}^N$ . It has the following properties.

- $P(\mathbf{x}) = \mathbf{x} \mathbf{x}^T - \det(\mathbf{x}) J$ ,
- $P(\mathbf{x})$  is symmetric and positive definite,
- $P(\mathbf{x})$  and  $L(\mathbf{x})$  commute and thus share a set of eigenvectors,
- $P(\mathbf{x}) \mathbf{e} = \mathbf{x}^2$ ,
- $P(\mathbf{x})^\alpha = P(\mathbf{x}^\alpha)$ , if  $\mathbf{x}^\alpha$  exists,
- $P(\mathbf{x}^{-1}) \mathbf{y}^{-1} = (P(\mathbf{x}) \mathbf{y})^{-1}$  if  $\mathbf{x}$  and  $\mathbf{y}$  are invertible,
- $P(P(\mathbf{x}) \mathbf{y}) = P(\mathbf{x}) P(\mathbf{y}) P(\mathbf{x})$  and
- $P(\mathbf{x}) C = C$  and  $P(\mathbf{x}) \text{int } C = \text{int } C$  if  $\mathbf{x}$  is invertible.

The eigenvalues of  $P(\mathbf{x})$  are

$$\lambda_1 = \lambda_1(\mathbf{x})^2 = \frac{1}{2} (x_{\mathbf{n}} - \|\mathbf{x}_{\mathbf{t}}\|)^2, \\ \lambda_2 = \lambda_2(\mathbf{x})^2 = \frac{1}{2} (x_{\mathbf{n}} + \|\mathbf{x}_{\mathbf{t}}\|)^2, \\ \lambda_k = \det(\mathbf{x}) = \frac{1}{2} (x_{\mathbf{n}}^2 - \|\mathbf{x}_{\mathbf{t}}\|^2) \quad \text{for } k = 3, \dots, N.$$

(i) For  $\mathbf{x}, \mathbf{y} \in \mathbb{R}^N$ , let  $\mathbf{v} = P(\mathbf{x})^{\frac{1}{2}}\mathbf{y}$ . It holds

$$\begin{aligned}\det(\mathbf{v}) &= \det(\mathbf{x}) \cdot \det(\mathbf{y}), \\ \text{tr}(\mathbf{v}) &= \mathbf{x}^T \mathbf{y}.\end{aligned}$$

It follows, that the spectral values of  $\mathbf{v}$  are

$$\begin{aligned}\lambda_1(\mathbf{v}) &= \frac{\mathbf{x}^T \mathbf{y}}{2} - \sqrt{\left[\frac{\mathbf{x}^T \mathbf{y}}{2}\right]^2 - \det(\mathbf{x}) \det(\mathbf{y})}, \\ \lambda_2(\mathbf{v}) &= \frac{\mathbf{x}^T \mathbf{y}}{2} + \sqrt{\left[\frac{\mathbf{x}^T \mathbf{y}}{2}\right]^2 - \det(\mathbf{x}) \det(\mathbf{y})}.\end{aligned}$$

(j) There exists a unique automorphism  $W = W(\mathbf{x}, \mathbf{y})$  such that for  $\mathbf{x}, \mathbf{y} \in \text{int } C$  it holds  $W\mathbf{x} = W^{-1}\mathbf{y}$ . The automorphism is given by

$$W(\mathbf{x}, \mathbf{y}) = P(\mathbf{w}^{\frac{1}{2}})$$

with

$$\mathbf{w} = P(\mathbf{x}^{-\frac{1}{2}}) \left( P(\mathbf{x}^{\frac{1}{2}}) \mathbf{y} \right)^{\frac{1}{2}}.$$

The vector  $\mathbf{w} \in \mathbb{R}^N$  is called the scaling point for  $\mathbf{x}, \mathbf{y} \in C$ . It holds  $\mathbf{w} \in \text{int } C$  and thus

$$W \text{int } C = W^{-1} \text{int } C = \text{int } C.$$

(k) The direct product of  $n$  symmetric cones

$$\mathcal{C} = C \times \dots \times C \in \mathbb{R}^{N \cdot n}$$

is a symmetric cone and  $(\mathbb{R}^{N \cdot n}, \diamond)$  is a Jordan algebra with Jordan product

$$\mathbf{x} \diamond \mathbf{y} = \begin{bmatrix} \mathbf{x}_1 \circ \mathbf{y}_1 \\ \vdots \\ \mathbf{x}_n \circ \mathbf{y}_n \end{bmatrix}.$$

All the properties of  $(\mathbb{R}^N, \circ)$  hold for  $(\mathbb{R}^{N \cdot n}, \diamond)$  and have to be understood componentwise.

To avoid overloading the notation, we use the same names in  $\mathbb{R}^N \times \dots \times \mathbb{R}^N$  as in  $\mathbb{R}^N$  in the remainder of this paper. E.g., both the unit element in  $\mathbb{R}^N \times \dots \times \mathbb{R}^N$  and the unit element in  $\mathbb{R}^N$  are denoted by  $\mathbf{e}$  and the respective Jordan Product of  $\mathbf{x}$  and  $\mathbf{y}$  is written as  $\mathbf{x} \circ \mathbf{y}$ . We only comment on the dimension if it is not clear from the context.

#### 4. The Interior Point Algorithm

In this section, we illustrate our Interior Point algorithm to solve the CCP (12). The goal is to formulate the IPM analogously to the algorithms presented in (Kojima et al., 1991) for Linear Complementarity Problems<sup>3</sup>.

<sup>3</sup>A Linear Complementarity Problem is a Cone Complementarity Problem where the Jordan product is the componentwise product and the symmetric cone is the positive orthant  $\mathcal{C} = \mathbb{R}_+^n$ .

This is done in six steps: In Section 4.1 we interpret the Cone Complementarity Problem as a minimization of a potential function. The central path is defined and the idea behind path-following is stated in Section 4.2. One way of constructing a feasible starting point for the Interior Point Method is explained in Section 4.3. We discuss the maximum stepping length in Section 4.4. One way of improving the convergence rate, the Nesterov–Todd scaling, is introduced in Section 4.5. Inexact search directions are discussed in Section 4.6. We conclude this section with a pseudo-code of the Interior Point Method.

##### 4.1. The Potential Function

To make use of the algebraic structure presented in Section 3, the cones  $\mathcal{K}_\mu$  and  $\mathcal{K}_\mu^*$  must first be transformed to a symmetric cone  $\mathcal{C} = \mathcal{C}^*$ . Using the transformations

$$\begin{aligned}\mathbf{x} &= \mathcal{T}_x \cdot \boldsymbol{\lambda} = \begin{bmatrix} T_{\mu_1}^x & & \\ & \ddots & \\ & & T_{\mu_n}^x \end{bmatrix} \cdot \boldsymbol{\lambda}, \\ \mathbf{y} &= \mathcal{T}_y \cdot \mathbf{u} = \begin{bmatrix} T_{\mu_1}^y & & \\ & \ddots & \\ & & T_{\mu_n}^y \end{bmatrix} \cdot \mathbf{u}\end{aligned}$$

with

$$T_{\mu_i}^x := \begin{bmatrix} \mu_i & & \\ & 1 & \\ & & 1 \end{bmatrix} \quad \text{and} \quad T_{\mu_i}^y := \begin{bmatrix} 1 & & \\ & \mu_i & \\ & & \mu_i \end{bmatrix}$$

and

$$F(\mathbf{x}) = \mathcal{T}_y \cdot \bar{F}(\mathcal{T}_x^{-1} \cdot \mathbf{x}) \quad \text{for all } \mathbf{x} \in \mathbb{R}^{3n}$$

we can rewrite the CCP (12) as

$$\mathcal{C} \ni \mathbf{x} \perp \mathbf{y} = F(\mathbf{x}) \in \mathcal{C} \quad (15)$$

in terms of the cone  $\mathcal{C} = C \times \dots \times C$  with

$$C = \left\{ \begin{bmatrix} x_n \\ \mathbf{x}_t \end{bmatrix} \in \mathbb{R} \times \mathbb{R}^2 \mid x_n \geq \|\mathbf{x}_t\| \right\}.$$

In the remainder of this paper we are concerned with the CCP (15).

##### Proposition 1.

$$\mathbf{x}^T \mathbf{y} = 0, \mathbf{x}, \mathbf{y} \in \mathcal{C} \quad \Leftrightarrow \quad \mathbf{x} \circ \mathbf{y} = \mathbf{0}, \mathbf{x}, \mathbf{y} \in \mathcal{C}$$

In (Fukushima et al., 2002) a proof of Proposition 1 is given for the cone  $C$ , which can easily be extended for the cone  $\mathcal{C} = C \times \dots \times C$  by using the fact that for  $\mathbf{x}_i, \mathbf{y}_i \in C$  it holds  $\mathbf{x}_i^T \mathbf{y}_i \geq 0$  and thus

$$\mathbf{x}^T \mathbf{y} = 0 \quad \Leftrightarrow \quad \mathbf{x}_i^T \mathbf{y}_i = 0, \text{ for } i = 1, \dots, n.$$

Let

$$S_{++} := \{(\mathbf{x}, \mathbf{y}) \in \mathbb{R}^{3n} \times \mathbb{R}^{3n} \mid \mathbf{x}, \mathbf{y} \in \text{int } \mathcal{C}, \mathbf{y} = F(\mathbf{x})\}$$

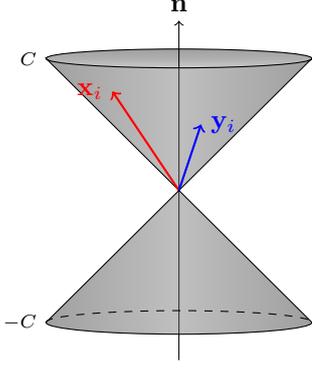

Figure 4: A point  $(\mathbf{x}, \mathbf{y}) \in S_{++}$  requires  $\mathbf{x}_i, \mathbf{y}_i \in \text{int } C$  for all  $i = 1, \dots, n$ ; while  $\det(\mathbf{x}_i), \det(\mathbf{y}_i) \geq 0$  only implies  $\mathbf{x}_i, \mathbf{y}_i \in C \cup (-C)$ .

denote the set of interior points. We can interpret (15) as the minimization problem

$$\min \mathbf{x}^T \mathbf{y} \quad \text{subject to} \quad (\mathbf{x}, \mathbf{y}) \in \overline{S_{++}}. \quad (16)$$

It is convenient for the definition of the central path to minimize a potential function with a logarithmic barrier for the set

$$\mathcal{C} \cup (-\mathcal{C}) = \left\{ \mathbf{x} = \begin{bmatrix} \mathbf{x}_1 \\ \vdots \\ \mathbf{x}_n \end{bmatrix} \in \mathbb{R}^{3n} \mid \det(\mathbf{x}_i) \geq 0 \forall i = 1, \dots, n \right\}$$

rather than using a logarithmic barrier for  $\mathcal{C}$ , see Figure 4. This gives rise to the minimization of the potential function

$$f(\mathbf{x}, \mathbf{y}) = (2n + \rho) \log \mathbf{x}^T \mathbf{y} - 2n \log n - \sum_{i=1}^n \log(2 \det(\mathbf{x}_i)) - \sum_{i=1}^n \log(2 \det(\mathbf{y}_i))$$

where  $\rho > 0$  is an arbitrary positive constant. The first two terms are a scaled version of the cost function in (16). The last two terms act as a logarithmic potential that drives  $\mathbf{x}_i$  and  $\mathbf{y}_i$  away from the manifold defined by  $\det(\mathbf{x}_i) = 0, \det(\mathbf{y}_i) = 0, i = 1, \dots, n$ , i.e. the boundary of the double cone  $\mathcal{C} \cup (-\mathcal{C})$ . We split the potential function into two

parts via

$$\begin{aligned} f(\mathbf{x}, \mathbf{y}) &= \rho \log \mathbf{x}^T \mathbf{y} + f_{cen}(\mathbf{x}, \mathbf{y}), \\ f_{cen}(\mathbf{x}, \mathbf{y}) &:= 2n \log \mathbf{x}^T \mathbf{y} - 2n \log n \\ &\quad - \sum_{i=1}^n \log(2 \det(\mathbf{x}_i)) - \sum_{i=1}^n \log(2 \det(\mathbf{y}_i)) \\ &= 2n \log \left( \frac{\mathbf{x}^T \mathbf{y}}{n} \right) \\ &\quad - 2n \log \left( \prod_{i=1}^n [4 \det(\mathbf{x}_i) \det(\mathbf{y}_i)]^{1/2n} \right) \\ &= 2n \log \frac{\mathbf{x}^T \mathbf{y} / n}{\prod_{i=1}^n [2 \sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)}]^{1/n}}. \quad (17) \end{aligned}$$

**Lemma 1.** Let  $\mathbf{x} = \begin{bmatrix} x_n \\ \mathbf{x}_t \end{bmatrix} \in \text{int } C$  and  $\det(\mathbf{y}) \geq 0$ .

- (a)  $2\sqrt{\det(\mathbf{x}) \cdot \det(\mathbf{y})} \leq |\mathbf{x}^T \mathbf{y}|$ .  
(b)  $2\sqrt{\det(\mathbf{x}) \cdot \det(\mathbf{y})} = |\mathbf{x}^T \mathbf{y}| \Leftrightarrow \mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e}$  for some  $\alpha \in \mathbb{R}$ .

*Proof.*

- (a) Let  $\mathbf{v} = P(\mathbf{x})^{\frac{1}{2}} \mathbf{y}$ . Then, because of Section 3(i), the left-hand side in (a) is twice the geometric mean of the spectral values  $\lambda_1, \lambda_2$  of  $\mathbf{v}$ , and the right-hand side is twice their arithmetic mean:

$$\begin{aligned} \sqrt{\det(\mathbf{x}) \cdot \det(\mathbf{y})} &= \sqrt{\det(\mathbf{v})} = \sqrt{\lambda_1 \cdot \lambda_2} \\ \frac{\mathbf{x}^T \mathbf{y}}{2} &= \frac{\text{tr}(\mathbf{v})}{2} = \frac{1}{2} (\lambda_1 + \lambda_2). \end{aligned}$$

$\mathbf{x}$  is invertible because of  $\mathbf{x} \in \text{int } C$ . It follows, that  $\mathbf{x}^{\frac{1}{2}}$  is invertible:

$$0 \neq \det(\mathbf{x}) = \det(\mathbf{x}^{\frac{1}{2}})^2.$$

With  $\det(\mathbf{y}) \geq 0$  we have  $\mathbf{y} \in C \cup (-C)$ . We distinguish two cases.

- $\mathbf{y} \in C$   
With (h) from section 3 it follows  $\mathbf{v} = P(\mathbf{x})^{\frac{1}{2}} \mathbf{y} \in C$ . Thus, the spectral values

$$\begin{aligned} \lambda_1 &= \frac{1}{\sqrt{2}} (v_n - \|\mathbf{v}_t\|) \quad \text{and} \\ \lambda_2 &= \frac{1}{\sqrt{2}} (v_n + \|\mathbf{v}_t\|) \end{aligned}$$

are non-negative and the arithmetic mean of two non-negative values is always greater or equal to their geometric mean.

- $\mathbf{y} \in -C$

Just as in the first case we can use 3(h) to obtain

$$-\mathbf{v} = P(\mathbf{x})^{\frac{1}{2}}(-\mathbf{y}) \in C \quad \Leftrightarrow \quad \mathbf{v} \in -C.$$

and thus

$$\begin{aligned} 0 &\geq \lambda_1 = \frac{1}{\sqrt{2}}(v_{\mathbf{n}} - \|\mathbf{v}_{\mathbf{t}}\|) \quad \text{and} \\ 0 &\geq \lambda_2 = \frac{1}{\sqrt{2}}(v_{\mathbf{n}} + \|\mathbf{v}_{\mathbf{t}}\|). \end{aligned}$$

Let  $\tilde{\lambda}_1 = -\lambda_1$  and  $\tilde{\lambda}_2 = -\lambda_2$ . Analogously to the first case, we conclude

$$\begin{aligned} \sqrt{\tilde{\lambda}_1 \tilde{\lambda}_1} &= \sqrt{\lambda_1 \lambda_2} = \sqrt{\det(\mathbf{x}) \det(\mathbf{y})} \\ &\leq \frac{1}{2}(\tilde{\lambda}_1 + \tilde{\lambda}_2) = -\frac{1}{2}(\lambda_1 + \lambda_2) = -\frac{\mathbf{x}^T \mathbf{y}}{2} \\ &= \frac{1}{2}|\mathbf{x}^T \mathbf{y}|. \end{aligned}$$

- (b) Without loss of generality, let  $\mathbf{y} \in C$ . If  $\mathbf{y} \in -C$  we follow the same steps using  $\tilde{\lambda}_1 = -\lambda_1$  and  $\tilde{\lambda}_2 = -\lambda_2$  just as in the first part of the proof.

It holds  $\sqrt{\det(\mathbf{x}) \cdot \det(\mathbf{y})} = \frac{\mathbf{x}^T \mathbf{y}}{2}$ , if the arithmetic mean of  $\lambda_1(\mathbf{v})$  and  $\lambda_2(\mathbf{v})$  is equal to the geometric mean, i.e. if and only if

$$\begin{aligned} \lambda_1 &= \frac{1}{\sqrt{2}}(v_{\mathbf{n}} - \|\mathbf{v}_{\mathbf{t}}\|) \\ &= \lambda_2 = \frac{1}{\sqrt{2}}(v_{\mathbf{n}} + \|\mathbf{v}_{\mathbf{t}}\|). \end{aligned}$$

Therefore it needs to be shown, that

$$\mathbf{v}_{\mathbf{t}} = \mathbf{0} \quad \Leftrightarrow \quad \mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e} \quad \alpha \in \mathbb{R}.$$

Since  $\mathbf{x}$  is invertible,  $P(\mathbf{x}^{\frac{1}{2}}) = P(\mathbf{x})^{\frac{1}{2}}$  is invertible and using 3(h) we know that

$$\mathbf{x}^{-1} = P(\mathbf{x}^{-\frac{1}{2}})\mathbf{e}.$$

In addition, it holds  $L(\mathbf{x}^{-1}) = L(\mathbf{x})^{-1}$  because of

$$\begin{aligned} \mathbf{e} &= L(\mathbf{x}^{-1})\mathbf{x} \\ \Leftrightarrow \mathbf{x} &= L(\mathbf{x})\mathbf{e} = L(\mathbf{x})L(\mathbf{x}^{-1})\mathbf{x} \\ \Leftrightarrow L(\mathbf{x})L(\mathbf{x}^{-1}) &= \text{Id} \end{aligned}$$

for all invertible  $\mathbf{x}$ . Therefore,

$$\begin{aligned} \mathbf{v}_{\mathbf{t}} = \mathbf{0} &\Leftrightarrow \mathbf{v} = P(\mathbf{x}^{\frac{1}{2}})\mathbf{y} = \alpha \mathbf{e}, \quad \alpha \in \mathbb{R} \\ &\Leftrightarrow \mathbf{y} = \alpha P(\mathbf{x}^{-\frac{1}{2}})\mathbf{e} \\ &\Leftrightarrow \mathbf{y} = \alpha \mathbf{x}^{-1} = \alpha L(\mathbf{x}^{-1})\mathbf{e} \\ &\Leftrightarrow L(\mathbf{x})\mathbf{y} = \alpha \mathbf{e} \\ &\Leftrightarrow \mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e} \end{aligned}$$

**Theorem 1.** Let  $(\mathbf{x}, \mathbf{y}) \in S_{+++}$ .

(a)  $f_{cen}(\mathbf{x}, \mathbf{y}) \geq 0$

(b)  $f_{cen}(\mathbf{x}, \mathbf{y}) = 0 \quad \Leftrightarrow \quad \mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e} \quad \text{for some } \alpha > 0.$

*Proof.*

- (a) From Lemma 1(a) follows

$$\mathbf{x}_i^T \mathbf{y}_i \geq 2\sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)} \quad \text{for all } i = 1, \dots, n. \quad (18)$$

Since the terms on the left and right hand side of the equation are both non-negative, we can take the product over all  $i$  on both sides and apply the  $n$ -th root to obtain

$$\left( \prod_{i=1}^n \mathbf{x}_i^T \mathbf{y}_i \right)^{\frac{1}{n}} \geq \left( \prod_{i=1}^n 2\sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)} \right)^{\frac{1}{n}}. \quad (19)$$

The result follows from the fact that the arithmetic mean of a set of positive numbers is always larger or equal to its geometric mean,

$$\frac{1}{n} \mathbf{x}^T \mathbf{y} \geq \left( \prod_{i=1}^n \mathbf{x}_i^T \mathbf{y}_i \right)^{\frac{1}{n}} \geq \left( \prod_{i=1}^n 2\sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)} \right)^{\frac{1}{n}}. \quad (20)$$

Therefore the term in the logarithm in equation (17) is larger than one and we have

$$f_{cen}(\mathbf{x}, \mathbf{y}) \geq 0.$$

- (b) With Lemma 1(b) we know, that the inequalities in (18) and (19) hold with equality, if and only if  $\mathbf{x}_i \circ \mathbf{y}_i = \alpha_i \mathbf{e}$  for all  $i = 1, \dots, n$  and some  $\alpha_i \geq 0$ .

The first inequality in (20) holds with equality, if and only if

$$0 \leq \mathbf{x}_i^T \mathbf{y}_i = \mathbf{x}_j^T \mathbf{y}_j \quad \text{for all } i, j \in \{1, \dots, n\}.$$

Nominator and denominator in (17) are equal if and only if  $\alpha_i = \alpha_j$  for all  $i, j \in \{1, \dots, n\}$  and therefore it must hold for some  $\alpha \geq 0$

$$\mathbf{x}_i \circ \mathbf{y}_i = \alpha \mathbf{e} \quad \text{for all } i = 1, \dots, n$$

and the claim is proved.  $\square$

Because of Theorem 1(a) we know that

$$f(\mathbf{x}, \mathbf{y}) \geq \rho \log \mathbf{x}^T \mathbf{y}$$

for any  $\rho \geq 0$ , and we can regard each  $(\mathbf{x}, \mathbf{y}) \in S_{+++}$  with a small  $f(\mathbf{x}, \mathbf{y})$  as an approximate solution to the CCP (15).  $\square$

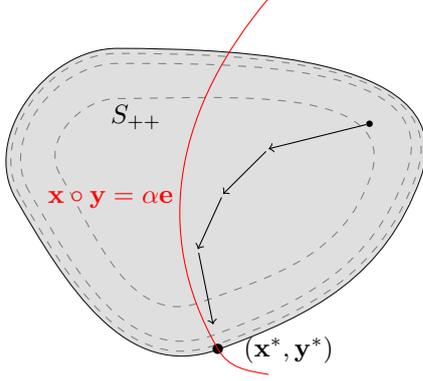

Figure 5: A sequence  $(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  approaching the optimum  $(\mathbf{x}^*, \mathbf{y}^*)$  in a small neighborhood of the central path.

#### 4.2. The Central Path

The logarithmic barrier  $f_{cen}$  penalizes values close to the boundary, since the denominator in the logarithm in equation (17) tends towards zero as  $(\mathbf{x}, \mathbf{y}) \in S_{++}$  approaches the boundary of the feasible set. Let  $(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  be a sequence in  $S_{++}$  that approaches an optimum  $(\mathbf{x}^*, \mathbf{y}^*)$  of (16). If  $f_{cen}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) = 0$ , the sequence approaches the boundary of  $S_{++}$  from the interior as fast as it decreases the cost function  $\mathbf{x}^T \mathbf{y} / n$ , and therefore, the sequence approaches the optimum strictly from within the feasible set, staying clear from the constraints.

The central path is defined as

$$\begin{aligned} S_{cen} &= \{ (\mathbf{x}, \mathbf{y}) \in S_{++} \mid f_{cen}(\mathbf{x}, \mathbf{y}) = 0 \} \\ &= \{ (\mathbf{x}, \mathbf{y}) \in S_{++} \mid \mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e}, \alpha > 0 \}. \end{aligned}$$

In practice, it is not possible to rigorously enforce  $f_{cen}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) = 0$ . Instead, one tries to find a sequence in a small neighborhood of the central path, see Figure 5.

A Newton step applied to the function

$$\mathbf{g}(\mathbf{x}, \mathbf{y}) = \mathbf{x} \circ \mathbf{y} - \alpha \mathbf{e} = \mathbf{0}$$

is a step towards the central path at  $\alpha$ . Given  $(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \in S_{++}$ , the search direction of the Interior Point method is given by a solution to

$$\begin{aligned} &\begin{bmatrix} \nabla_{\mathbf{x}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) & \nabla_{\mathbf{y}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \\ \nabla F(\mathbf{x}^{(k)}) & -I \end{bmatrix} \begin{bmatrix} \Delta \mathbf{x}^{(k)} \\ \Delta \mathbf{y}^{(k)} \end{bmatrix} \\ &= \begin{bmatrix} \alpha \mathbf{e} - \mathbf{x}^{(k)} \circ \mathbf{y}^{(k)} \\ \mathbf{0} \end{bmatrix} \end{aligned}$$

The matrices  $\nabla_{\mathbf{x}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \in \mathbb{R}^{3n \times 3n}$  and  $\nabla_{\mathbf{y}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \in \mathbb{R}^{3n \times 3n}$  are block-diagonal with  $3 \times 3$  blocks

$$\begin{aligned} \left( \nabla_{\mathbf{x}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \right)_{i,i} &= L(\mathbf{y}_i^{(k)}) \\ \left( \nabla_{\mathbf{y}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \right)_{i,i} &= L(\mathbf{x}_i^{(k)}), \end{aligned}$$

for  $i = 1, \dots, n$ . In the remainder of this paper we write

$$\begin{aligned} L(\mathbf{y}^{(k)}) &:= \nabla_{\mathbf{x}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \\ L(\mathbf{x}^{(k)}) &:= \nabla_{\mathbf{y}} \mathbf{g}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) \end{aligned}$$

according to our comments in 3(k).

Finally, we choose a special value for  $\alpha$  given by

$$\alpha = \beta \frac{\mathbf{x}^{(k)T} \mathbf{y}^{(k)}}{2n},$$

where  $\beta \in (0, 1]$  is a parameter. A choice of  $\beta = 1$  means we are looking for the point  $(\mathbf{x}', \mathbf{y}')$  on the central path with minimal Euclidean distance  $\|(\mathbf{x}^{(k)}, \mathbf{y}^{(k)}) - (\mathbf{x}', \mathbf{y}')\|$ , while  $\beta = 0$  would yield a Newton step aiming at optimality of (16) regardless of the path of centers. We choose the value for  $\beta$  at the beginning of each Newton step depending on the momentary value of  $f_{cen}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$ . If  $f_{cen}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  is large, we are close to the boundary and we make a centralizing step towards the path of centers using a large value of  $\beta \in (0, 1]$ . If  $f_{cen}(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  is small, we are already fairly central and we can venture a minimizing step with a small  $\beta \in (0, 1]$ .

#### 4.3. A feasible starting point

For the IPM to work, we need a feasible starting point  $(\mathbf{x}^{(0)}, \mathbf{y}^{(0)}) \in S_{++}$ . In other words we need to find  $\mathbf{x}^{(0)} \in \text{int } \mathcal{C}$  such that  $F(\mathbf{x}^{(0)}) \in \text{int } \mathcal{C}$ . This is not a trivial task. The goal of this section is to generalize an approach given in (Kojima et al., 1991) to construct a feasible starting point to a similar CCP. The idea is to introduce one artificial variable and transform the original complementarity problem of size  $3n$  into a complementarity problem of size  $3n + 1$  with an obvious starting point.

We introduce the additional variable  $s \in \mathbb{R}_+$  and a vector  $\mathbf{d} \in \mathbb{R}^{3n}$  and consider the complementarity problem

$$\begin{aligned} \tilde{\mathcal{C}} \ni \tilde{\mathbf{x}} &= \begin{bmatrix} \mathbf{x} \\ s \end{bmatrix} \\ \tilde{\mathcal{C}} \ni \tilde{\mathbf{y}} &= \begin{bmatrix} \tilde{\mathbf{y}} \\ 1 \end{bmatrix} \\ &= \tilde{F}(\tilde{\mathbf{x}}) = \begin{bmatrix} F(\mathbf{x}) + s \cdot \mathbf{d} \\ 1 \end{bmatrix} \\ 0 &= \tilde{\mathbf{x}}^T \tilde{\mathbf{y}}, \end{aligned} \quad (21)$$

where  $\tilde{\mathcal{C}} = \mathcal{C} \times \mathbb{R}_+$ . Note that  $\mathbb{R}_+$  is the cone of squares in the Jordan algebra  $(\mathbb{R}, \cdot)$ , where  $\cdot : \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$  is the standard multiplication of two scalars.  $(\mathbb{R}, \cdot)$  has the same structure as  $(\mathbb{R}^3, \circ)$  and all results from section 3 apply analogously. The central path of the new CCP is the zero set of

$$f_{cen}(\tilde{\mathbf{x}}, \tilde{\mathbf{y}}) = 2(n+1) \log \frac{(\mathbf{x}^T \tilde{\mathbf{y}} + s) / (n+1)}{\prod_{i=1}^n [2s \sqrt{\det(\mathbf{x}_i) \det(\tilde{\mathbf{y}}_i)}]^{1/n}}.$$

Assume, an initial feasible guess  $\mathbf{x}^{(0)}$  for the original problem is given. For example,  $\mathbf{x}_i^{(0)} = (1, 0, 0)^T$  obviously

lies in  $\text{int } C$  for all  $i = 1, \dots, n$ . We now choose  $s^{(0)}$  and  $\mathbf{d}$ , such that

$$\bar{\mathbf{y}}^{(0)} = \tilde{\mathbf{y}}_{\{1, \dots, 3n\}}^{(0)} = F(\mathbf{x}^{(0)}) + s^{(0)} \mathbf{d} \in \text{int } C.$$

We can even choose these parameters in such a way, that  $(\tilde{\mathbf{x}}^{(0)}, \tilde{\mathbf{y}}^{(0)})$  lies on a point  $\alpha > 0$  of our choice on the central path

$$\tilde{\mathbf{x}}^{(0)} \circ \tilde{\mathbf{y}}^{(0)} = \alpha \mathbf{e}$$

of the CCP (21). For all  $i = 1, \dots, n$  it must hold

$$\begin{aligned} \begin{bmatrix} \sqrt{2\alpha} \\ \mathbf{0} \end{bmatrix} &= \frac{1}{\sqrt{2}} \begin{bmatrix} x_{in}^{(0)} \bar{y}_{in}^{(0)} + \mathbf{x}_{it}^{(0)T} \bar{\mathbf{y}}_{it}^{(0)} \\ x_{in}^{(0)} \bar{\mathbf{y}}_{it}^{(0)} + \bar{y}_{in}^{(0)} \mathbf{x}_{it}^{(0)} \end{bmatrix} \\ \Rightarrow \bar{y}_{in}^{(0)} &= \frac{2\alpha}{x_{in}^{(0)} - \frac{\|\mathbf{x}_{it}^{(0)}\|^2}{x_{in}^{(0)}}} \\ \text{and } \bar{\mathbf{y}}_{it}^{(0)} &= - \left( \frac{\bar{y}_{in}^{(0)}}{x_{in}^{(0)}} \right) \mathbf{x}_{it}^{(0)}. \end{aligned}$$

For the last complementarity condition we have to make sure, that

$$s^{(0)} \cdot 1 = s^{(0)} = \mathbf{x}_i^{(0)T} \bar{\mathbf{y}}_i^{(0)} = 2\alpha.$$

This in turn means, that

$$\mathbf{d} = \frac{1}{2\alpha} \left( \bar{\mathbf{y}}^{(0)} - F(\mathbf{x}^{(0)}) \right).$$

Note that, in theory we could choose an initial guess arbitrarily close to the optimal solution of (21) by choosing a small  $\alpha$ . But a small  $\alpha$  implies a large  $\mathbf{d}$ , so that the system is badly scaled if  $s^{(0)} = 2\alpha$  is too small.

A search direction for (21) is given by

$$\begin{aligned} &\begin{bmatrix} L(\bar{\mathbf{y}}^{(k)}) & L(\mathbf{x}^{(k)}) & \mathbf{0} \\ \nabla F(\mathbf{x}^{(k)}) & -I & \mathbf{d} \\ \mathbf{0} & \mathbf{0} & 1 \end{bmatrix} \begin{bmatrix} \Delta \mathbf{x}^{(k)} \\ \Delta \bar{\mathbf{y}}^{(k)} \\ \Delta s^{(k)} \end{bmatrix} \\ &= \begin{bmatrix} \alpha \mathbf{e} - L(\mathbf{x}^{(k)}) \bar{\mathbf{y}}^{(k)} \\ \mathbf{0} \\ 2\alpha - s^{(k)} \end{bmatrix} \end{aligned} \quad (22)$$

or equivalently by

$$\begin{aligned} \Delta s^{(k)} &= 2\alpha - s^{(k)}, \\ \tilde{A} \Delta \mathbf{x}^{(k)} &= \mathbf{b}, \\ \Delta \bar{\mathbf{y}}^{(k)} &= \nabla F(\mathbf{x}^{(k)}) \Delta \mathbf{x}^{(k)} + \Delta s^{(k)} \mathbf{d}. \end{aligned} \quad (23)$$

where

$$\begin{aligned} \tilde{A} &= \left[ L(\mathbf{x}^{(k)})^{-1} L(\bar{\mathbf{y}}^{(k)}) + \nabla F(\mathbf{x}^{(k)}) \right] \\ \mathbf{b} &= \alpha \left( \mathbf{x}^{(k)} \right)^{-1} - \bar{\mathbf{y}}^{(k)} - \Delta s^{(k)} \mathbf{d}. \end{aligned}$$

Since an optimal solution  $(\tilde{\mathbf{x}}^*, \tilde{\mathbf{y}}^*)$  implies that  $s^* = 0$ , it follows that  $(\mathbf{x}^*, \bar{\mathbf{y}}^*) = (\mathbf{x}^*, \mathbf{y}^*)$  is optimal for the original CCP. If  $s^{(k)} \not\rightarrow 0$ , the original CCP (15) is infeasible. During the iteration,  $s^{(k)}$  decreases and eventually

$\mathbf{y}^{(k)} = \bar{\mathbf{y}}^{(k)} - s^{(k)} \mathbf{d}$  is feasible. Then we can use the current iterate  $(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  as a starting point for a feasible Interior Point algorithm for the original CCP (15). In other words, we continue with the iteration, but replace  $\bar{\mathbf{y}}^{(k)}$  with  $\mathbf{y}^{(k)}$  and set  $s^{(l)} = 0$  and  $\Delta s^{(l)} = 0$  for all future iterations  $l > k$ .

#### 4.4. Maximum Stepping Length

Assume without loss of generality, that  $(\mathbf{x}, \bar{\mathbf{y}}) \in S_{++}$  is feasible. When an inexact iterative solver is used to determine the Newton direction some care has to be taken not to leave the set  $S_{++}$ . Hence, the next task in the derivation of the Interior Point Method is to identify the supremum of step sizes  $\theta > 0$ , such that

$$\begin{aligned} \mathbf{x} + \theta \Delta \mathbf{x} &\in \text{int } C \text{ and} \\ \bar{\mathbf{y}} + \theta \Delta \bar{\mathbf{y}} &\in \text{int } C. \end{aligned}$$

**Lemma 2.** *Let  $\mathbf{x} \in \text{int } C$  and  $\Delta \mathbf{x} \in \mathbb{R}^3$ . Then*

$$\mathbf{x} + \theta \Delta \mathbf{x} \in \text{int } C \Leftrightarrow \begin{cases} \Delta \mathbf{x} \in C \\ \text{or } \theta < \theta_{\max} \end{cases}$$

where

$$\theta_{\max} := \frac{\det(\mathbf{x})}{\sqrt{\left[ \frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2} \right]^2 - \det(\Delta \mathbf{x}) \det(\mathbf{x}) - \frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2}}}$$

*Proof.*

Let  $\mathbf{v} = P(\mathbf{x}^{-\frac{1}{2}}) \Delta \mathbf{x}$ .

- It holds  $P(\mathbf{x}^{\frac{1}{2}}) \mathbf{e} = \mathbf{x}$  and thus

$$\begin{aligned} \mathbf{x} + \theta \Delta \mathbf{x} \in \text{int } C &\Leftrightarrow P(\mathbf{x}^{\frac{1}{2}}) (\mathbf{e} + \theta \mathbf{v}) \in \text{int } C \\ &\Leftrightarrow \mathbf{e} + \theta \mathbf{v} \in \text{int } C \\ &\Leftrightarrow \begin{cases} \lambda_1(\mathbf{e} + \theta \mathbf{v}) > 0 \\ \lambda_2(\mathbf{e} + \theta \mathbf{v}) > 0 \end{cases} \\ &\Leftrightarrow \begin{cases} 1 + \theta \lambda_1(\mathbf{v}) > 0 \\ 1 + \theta \lambda_2(\mathbf{v}) > 0 \end{cases}, \end{aligned}$$

where the last equivalence holds because of

$$\begin{aligned} \lambda_i(\mathbf{e} + \theta \mathbf{v}) &= \frac{1}{\sqrt{2}} \left( \sqrt{2} + v_n \mp \|\theta \mathbf{v}_t\| \right) \\ &= 1 + \theta \lambda_i(\mathbf{v}), \quad i = 1, 2. \end{aligned}$$

If both spectral values of  $\mathbf{v}$  are non-negative, i.e. if  $\mathbf{v} \in \mathbf{C} \Leftrightarrow \Delta \mathbf{x} \in C$ , there is no restriction on  $\theta$ . If  $\lambda_1 = \min(\lambda_1(\mathbf{v}), \lambda_2(\mathbf{v}))$  is smaller than zero, we have

$$\theta < -\frac{1}{\lambda_1}. \quad (24)$$

- Using section 3(i) we know that

$$\begin{aligned}
\lambda_1 &= \frac{(\Delta \mathbf{x})^T \mathbf{x}^{-1}}{2} \\
&\quad - \sqrt{\left[ \frac{(\Delta \mathbf{x})^T \mathbf{x}^{-1}}{2} \right]^2 - \det(\mathbf{x}^{-1}) \det(\Delta \mathbf{x})} \\
&= \frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2 \det(\mathbf{x})} - \sqrt{\left[ \frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2 \det(\mathbf{x})} \right]^2 - \frac{\det(\Delta \mathbf{x})}{\det(\mathbf{x})}} \\
&= \frac{\frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2} - \sqrt{\left[ \frac{(\Delta \mathbf{x})^T J \mathbf{x}}{2} \right]^2 - \det(\mathbf{x}) \det(\Delta \mathbf{x})}}{\det(\mathbf{x})}.
\end{aligned} \tag{25}$$

Observe, that there are no imaginary solutions. If  $\det(\Delta \mathbf{x}) < 0$ , the term in the square root is positive. If  $\det(\Delta \mathbf{x}) \geq 0$ , the positivity of the term in the square root follows from Lemma 1.

- Finally we only need to check when  $\lambda_1$  is non-negative. We distinguish two cases.

(a)  $(\Delta \mathbf{x})^T \mathbf{x}^{-1} < 0$ .

We can easily see from (25), that  $\lambda_1$  is always negative.

(b)  $(\Delta \mathbf{x})^T \mathbf{x}^{-1} \geq 0$ .

From (25) we see, that  $\lambda_1$  is negative if  $\det(\Delta \mathbf{x}) < 0$ . With Lemma 1 follows that  $\lambda_1$  is non-negative, if  $\det(\Delta \mathbf{x})$  is non-negative. Because of  $\mathbf{x}^{-1} \in C \Leftrightarrow \mathbf{x} \in C$  we have  $(\Delta \mathbf{x})^T \mathbf{x}^{-1} \geq 0 \Leftrightarrow (\Delta \mathbf{x})^T \mathbf{x} \geq 0$  and therefore

$$\begin{aligned}
\lambda_1 \geq 0 &\Leftrightarrow \left\{ \begin{array}{l} (\Delta \mathbf{x})^T \mathbf{x} \geq 0 \\ \det(\Delta \mathbf{x}) \geq 0 \end{array} \right\} \\
&\Leftrightarrow \Delta \mathbf{x} \in C.
\end{aligned} \tag{26}$$

The upper bound for  $\theta$  in the case  $\Delta \mathbf{x} \notin C$  follows by inserting (25) into (24).

□

#### 4.5. Nesterov–Todd–Scaling

As the dot-product of  $\mathbf{x}_i$  and  $\bar{\mathbf{y}}_i$  decreases, at least one of the two vectors approaches the boundary of its feasible set  $C$ . But the search directions  $\Delta \mathbf{x}_i$  and  $\Delta \bar{\mathbf{y}}_i$  cannot be chosen independently, and closeness to the boundary restricts the choice in feasible step sizes. The convergence of the Interior Point Method can be improved substantially by rescaling the space in which the cone  $C$  lives at the beginning of each iteration. This is done using the Nesterov–Todd scaling scheme, or NT–Scaling, see (Nesterov and Todd, 1997; Bai et al., 2004). Loosely speaking, the idea is to rescale the vectors  $\mathbf{x}_i \mapsto \hat{\mathbf{x}}_i$  and  $\bar{\mathbf{y}}_i \mapsto \hat{\bar{\mathbf{y}}}_i$  such that  $\hat{\mathbf{x}}_i = \hat{\bar{\mathbf{y}}}_i$ , and neither vector is closer to the boundary than the other.

Consider the block-diagonal automorphism  $\hat{W} = \begin{bmatrix} W \\ w \end{bmatrix}$  introduced in section 3(j) satisfying  $\hat{W} \hat{\mathbf{x}}^{(k)} = \hat{W}^{-1} \hat{\bar{\mathbf{y}}}^{(k)}$ . Define  $\hat{\mathbf{v}} = \begin{bmatrix} \mathbf{v} \\ v_s \end{bmatrix} = \frac{1}{\sqrt{\alpha}} \hat{W} \hat{\mathbf{x}}^{(k)}$ , i.e.

$$\begin{aligned}
\mathbf{v} &= \frac{1}{\sqrt{\alpha}} W \mathbf{x}^{(k)} = \frac{1}{\sqrt{\alpha}} W^{-1} \bar{\mathbf{y}}^{(k)}, \\
v_s &= \frac{1}{\sqrt{\alpha}} w s^{(k)} = \frac{1}{\sqrt{\alpha}} w^{-1}
\end{aligned}$$

with  $w = \frac{1}{\sqrt{s^{(k)}}}$ . Using

$$\begin{aligned}
\mathbf{d}_x &:= \frac{1}{\sqrt{\alpha}} W \Delta \mathbf{x}^{(k)} \\
\mathbf{d}_y &:= \frac{1}{\sqrt{\alpha}} W^{-1} \Delta \bar{\mathbf{y}}^{(k)}, \\
d_s &:= \frac{1}{\sqrt{\alpha}} \frac{1}{\sqrt{s^{(k)}}} \Delta s^{(k)}
\end{aligned}$$

we can write (22) as

$$\begin{aligned}
&\begin{bmatrix} L(W \mathbf{v}) W^{-1} & L(W^{-1} \mathbf{v}) W & \mathbf{0} \\ \nabla F(\mathbf{x}^{(k)}) W^{-1} & -W & \sqrt{s^{(k)}} \mathbf{d} \\ \mathbf{0} & \mathbf{0} & v_s \end{bmatrix} \begin{bmatrix} \mathbf{d}_x \\ \mathbf{d}_y \\ d_s \end{bmatrix} \\
&= \begin{bmatrix} \mathbf{e} - L(W^{-1} \mathbf{v}) W \mathbf{v} \\ \mathbf{0} \\ 2 - v_s^2 \end{bmatrix}.
\end{aligned} \tag{27}$$

Next, we replace  $L(W \mathbf{v}) W^{-1}$  and  $L(W^{-1} \mathbf{v}) W$  by  $L(\mathbf{v})$ , premultiply the first equation with  $L(\mathbf{v})^{-1} = L(\mathbf{v}^{-1})$  and the last equation with  $v_s^{-1}$ . This gives the system of equations

$$\begin{aligned}
&\begin{bmatrix} I & I & \mathbf{0} \\ \nabla F(\mathbf{x}^{(k)}) W^{-1} & -W & \sqrt{s^{(k)}} \mathbf{d} \\ \mathbf{0} & \mathbf{0} & 1 \end{bmatrix} \begin{bmatrix} \mathbf{d}_x \\ \mathbf{d}_y \\ d_s \end{bmatrix} \\
&= \begin{bmatrix} \mathbf{v}^{-1} - \mathbf{v} \\ \mathbf{0} \\ 2v_s^{-1} - v_s \end{bmatrix}
\end{aligned} \tag{28}$$

or equivalently

$$\begin{aligned}
\Delta s^{(k)} &= 2\alpha - s^{(k)}, \\
A \Delta \mathbf{x}^{(k)} &= \mathbf{b}, \\
\Delta \bar{\mathbf{y}}^{(k)} &= \nabla F(\mathbf{x}^{(k)}) \Delta \mathbf{x}^{(k)} + \Delta s^{(k)} \mathbf{d}.
\end{aligned} \tag{29}$$

where

$$\begin{aligned}
A &= \left[ W^2 + \nabla F(\mathbf{x}^{(k)}) \right] \\
&= \left[ P(\mathbf{w}) + \nabla F(\mathbf{x}^{(k)}) \right] \\
\mathbf{b} &= \sqrt{\alpha} W \mathbf{v}^{-1} - \bar{\mathbf{y}}^{(k)} - \Delta s^{(k)} \mathbf{d} \\
&= \sqrt{\alpha} \left( P(\mathbf{w}^{-\frac{1}{2}}) \mathbf{v} \right)^{-1} - \bar{\mathbf{y}}^{(k)} - \Delta s^{(k)} \mathbf{d} \\
&= \sqrt{\alpha} (W^{-1} \mathbf{v})^{-1} - \bar{\mathbf{y}}^{(k)} - \Delta s^{(k)} \mathbf{d} \\
&= \alpha \left( \mathbf{x}^{(k)} \right)^{-1} - \bar{\mathbf{y}}^{(k)} - \Delta s^{(k)} \mathbf{d},
\end{aligned}$$

and  $\mathbf{w} \in \text{int } C$  is the scaling point for  $\mathbf{x}^{(k)}$  and  $\bar{\mathbf{y}}^{(k)}$ .

The linear system (29) is an approximation of the linear system (23). By successively solving (29) and updating  $W$  accordingly in an inner iteration,  $\mathbf{v}$  eventually satisfies  $\mathbf{v}^{-1} = \mathbf{v}$  which is equivalent to  $\mathbf{x} \circ \bar{\mathbf{y}} = \alpha \mathbf{e}$ . Then the centralizing parameter  $\alpha$  is updated and the process is repeated until the complementarity problem is solved (Bai et al., 2004). One could alternatively update  $\alpha$  after each inner iteration to find a new search direction. For instance, centralizing steps that do not improve the value of the cost function must not be solved with a very high accuracy and one inner iteration might suffice to get closer to the central path. Hence, there must not be a strict distinction between inner and outer iterations.

Apart from improving the convergence rate of the method, the approximation (29) yields a symmetric linear system, if  $\nabla F(\mathbf{x}^{(k)})$  is symmetric. This is not the case for (23), since  $L(\mathbf{x}^{(k)})^{-1}$  and  $L(\bar{\mathbf{y}}^{(k)})$  do not necessarily commute. One easily checks<sup>4</sup>, that

$$\begin{aligned} \nabla F(\mathbf{x}^{(k)}) &= \mathcal{T}_y \nabla \bar{F}(\mathcal{T}_x^{-1} \mathbf{x}^{(k)}) \mathcal{T}_x^{-1} \\ &\in \mathcal{T}_y \left( \bar{N} + \partial \bar{\mathbf{r}}(\mathcal{T}_x^{-1} \mathbf{x}^{(k)}) \right) \mathcal{T}_x^{-1} \end{aligned}$$

is only symmetric if the term  $\bar{\mathbf{r}}(\boldsymbol{\lambda})$  is ignored (see our comments at the end of section 2.4) and if the friction coefficients satisfy  $\mu_i = \mu_j$  for all  $i, j \in \{1, \dots, n\}$ . For  $\mu_i \neq \mu_j$  we can symmetrize the system via the transformation

$$\begin{aligned} A &\leftarrow \mathcal{T}_y^{-1} P(\mathbf{w}) T_x + \bar{N} \\ \mathbf{b} &\leftarrow \mathcal{T}_y^{-1} \mathbf{b} \\ A \Delta \boldsymbol{\lambda}^{(k)} &= \mathbf{b} \\ \Delta \mathbf{x}^{(k)} &= \mathcal{T}_x \Delta \boldsymbol{\lambda}^{(k)} \end{aligned}$$

because of the block–diagonality of  $P(\mathbf{w})$ .

We conclude the section on NT–scaling with an explicit formula for the scaling point of a contact.

**Lemma 3.** *The scaling point  $\mathbf{w} \in \mathbb{R}^3$  satisfying  $P(\mathbf{w}^{\frac{1}{2}}) \mathbf{x} = P(\mathbf{w}^{-\frac{1}{2}}) \mathbf{y}$  for  $\mathbf{x}, \mathbf{y} \in \text{int } C$  is*

$$\mathbf{w} = \frac{\mathbf{y} + \lambda J \mathbf{x}}{\sqrt{\mathbf{x}^T \mathbf{y} + 2\sqrt{\det(\mathbf{x}) \det(\mathbf{y})}}},$$

where

$$\lambda := \det(\mathbf{w}) = \sqrt{\frac{\det(\mathbf{y})}{\det(\mathbf{x})}}.$$

*Proof.* This proof is based on the one from (Bai et al., 2004). We know from 3(j), that

$$\mathbf{w} = P(\mathbf{x}^{-\frac{1}{2}}) \left( P(\mathbf{x}^{\frac{1}{2}}) \mathbf{y} \right)^{\frac{1}{2}}.$$

<sup>4</sup>Simply verify, that for any symmetric  $X \in \mathbb{R}^{3 \times 3}$  the matrix  $T_{\mu_i}^y X (T_{\mu_j}^x)^{-1}$  is equal to  $T_{\mu_j}^y X (T_{\mu_i}^x)^{-1}$  only if  $\mu_i = \mu_j$ .

With  $\mathbf{u} := \mathbf{x}^{-1}$  and  $\mathbf{v} := \left( P(\mathbf{x}^{\frac{1}{2}}) \mathbf{y} \right)^{\frac{1}{2}}$  we can use 3(i) to get

$$\det(\mathbf{w}) = \det(\mathbf{u}) \det(\mathbf{v}) = \frac{\det(\mathbf{v})}{\det(\mathbf{x})}.$$

Using 3(i) once more on  $\mathbf{v}^2 = P(\mathbf{x}^{\frac{1}{2}}) \mathbf{y}$  we obtain

$$\det(\mathbf{v})^2 = \det(\mathbf{v}^2) = \det(\mathbf{x}) \det(\mathbf{y})$$

and thus

$$\lambda = \det(\mathbf{w}) = \sqrt{\frac{\det(\mathbf{y})}{\det(\mathbf{x})}}.$$

With  $P(\mathbf{w}) = \mathbf{w} \mathbf{w}^T - \det(\mathbf{w}) J$  we can write

$$\begin{aligned} \mathbf{y} &= P(\mathbf{w}) \mathbf{x} = \mathbf{w} \mathbf{w}^T \mathbf{x} - \lambda J \mathbf{x} \\ \Rightarrow \mathbf{w} &= \frac{1}{\mathbf{w}^T \mathbf{x}} (\mathbf{y} + \lambda J \mathbf{x}). \end{aligned} \quad (30)$$

Taking the inner product of (30) with  $J \mathbf{w}$  gives

$$\begin{aligned} 2\lambda &= 2 \det(\mathbf{w}) = \mathbf{w}^T J \mathbf{w} \\ &= \frac{1}{(\mathbf{w}^T \mathbf{x})^2} (\mathbf{y}^T J \mathbf{y} + 2\lambda \mathbf{x}^T J J \mathbf{y} + \lambda^2 \mathbf{x}^T J J J \mathbf{x}). \end{aligned}$$

Making use of the fact that  $J J = I$  results in

$$\begin{aligned} (\mathbf{w}^T \mathbf{x})^2 &= \frac{1}{\lambda} \det(\mathbf{y}) + \mathbf{x}^T \mathbf{y} + \lambda \det(\mathbf{x}) \\ &= \mathbf{x}^T \mathbf{y} + 2\sqrt{\det(\mathbf{x}) \det(\mathbf{y})}. \end{aligned} \quad (31)$$

Inserting (31) into (30) yields the desired result.  $\square$

#### 4.6. Inexact Search Directions

Usually, in the context of soil simulations, the number of unknowns in every time step is quite high. Depending on the configuration, every soil particle is in contact with approximately 5 to 10 other particles and every contact has three unknowns – one for the normal reaction impulse and two for the tangential reaction impulses. In a simulation with one million particles one can expect to have around 15 to 30 million unknowns in every time step and a direct solver for the search direction is not an option.

Instead of directly solving the Newton step, we want to apply an iterative method to obtain inexact search directions in each IPM iteration. When using iterative methods such as Krylov subspace regimes, the convergence rate depends directly on the condition of the matrix  $A$ . Unfortunately, one intrinsic property of IPMs is that the condition of the system matrix  $A$  deteriorates close to the optimal solution. An additional difficulty is that  $\nabla F(\mathbf{x})$  is highly rank–deficient in almost all cases and the CCP does not have a unique solution. Figure 6 shows a simple, static, two–dimensional example with merely ten resting disks subject to frictionless contact. The associated Linear Complementarity Problem allows infinitely many solutions for the reaction impulses, of which all lead to the same zero–velocity state.

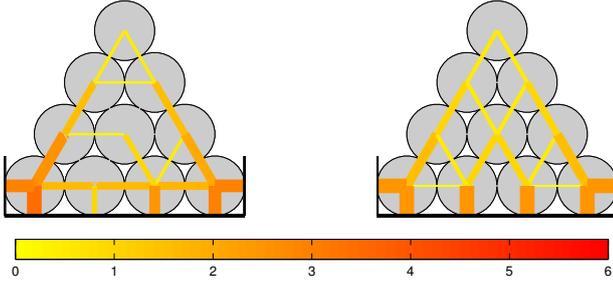

Figure 6: Two different valid impulse solutions to a simple example of a particle configuration allowing infinitely many solutions. The magnitude of the reaction impulses is visualized by the width and color of the lines connecting the two associated bodies.

Almost the entire computational effort of the Interior Point Method is spent on the solution of the Newton step. Therefore, some effort has been put into the regularization and preconditioning of the system. We follow the approach of (Gondzio, 2012) of regularizing the system first and then preconditioning it.

#### 4.6.1. Regularization

One way of regularizing a rank-deficient linear system is by adding a diagonal matrix  $R$  with small values to it,

$$A \leftarrow A + R.$$

$R = \text{diag}(\rho_1, \dots, \rho_{3n})$  is called the Tikhonov matrix and solving  $A\Delta\mathbf{x} = \mathbf{b}$  is equivalent to solving the minimization problem

$$\min_{\Delta\mathbf{x}} \|A\Delta\mathbf{x} - \mathbf{b}\|^2 + \|R\Delta\mathbf{x}\|^2.$$

The condition of the regularized system improves with the size of the regularization parameters  $\rho_i$ , but larger  $\rho_i$  give poorer approximations of the original problem.

Fortunately, in NSCD, the regularization parameters have a direct physical interpretation: They can be identified with finite normal and tangential stiffnesses in the contacts. Loosely speaking, regularization re-introduces smoothness into the non-smooth formulation without suffering from instabilities as they occur in the classical DEM, see (Lacoursire, 2007; Tasora et al., 2013). Instead, re-introducing finite stiffnesses improves the numerical properties of the linear systems. As perfectly rigid bodies are always just an approximation of the real world, the regularized system is in fact closer to reality than the original one, as long as the regularization parameters are sufficiently small. We follow the idea of (Tasora et al., 2013) and set  $R = \mathcal{T}_y \bar{R} \mathcal{T}_x^{-1}$  and

$$\bar{R} = \text{diag}([\rho_{1,\mathbf{n}}, \rho_{1,\mathbf{t}}, \rho_{1,\mathbf{t}}, \dots, \rho_{n,\mathbf{n}}, \rho_{n,\mathbf{t}}, \rho_{n,\mathbf{t}}]). \quad (32)$$

The regularization parameters

$$\rho_{i,\mathbf{n}} = \frac{1}{\Delta t^2 k_{i,\mathbf{n}}} \quad \text{and} \quad \rho_{i,\mathbf{t}} = \frac{1}{\Delta t^2 k_{i,\mathbf{t}}}$$

are calculated from normal and tangential stiffnesses  $k_{i,\mathbf{n}}$  and  $k_{i,\mathbf{t}}$  respectively for all contacts  $i = 1, \dots, n$ . The diagonal matrices  $\mathcal{T}_y$  and  $\mathcal{T}_x^{-1}$  are the transformations defined in the beginning of Section 4.1.

If the stiffness values are chosen carefully, regularization has more desirable properties. The authors of (Obermayr et al., 2011) calculate stiffnesses from the deformation of an elastic rod connecting the centers of mass of the particles. If the contact with index  $i$  is associated with the bodies  $A$  and  $B$ , the stiffnesses are given by

$$k_{i,\mathbf{n}} = \frac{\pi}{4} \hat{E} (r_A + r_B) \quad \text{and} \quad \frac{k_{i,\mathbf{n}}}{k_{i,\mathbf{t}}} = \frac{(2 - \nu)(1 + \nu)}{2(1 - \nu^2)} \quad (33)$$

where  $\hat{E}$  is the Young's modulus of the material,  $\nu$  the Poisson ratio,  $r_A$  and  $r_B$  are the radii of body  $A$  and  $B$  respectively. The stiffnesses in (33) yield a scale invariant model with respect to the particle size.

#### 4.6.2. Eigenvalues of the linear systems

The matrix of the linear system that has to be solved in every time step is

$$A = W^2 + \nabla F(\mathbf{x}^{(k)}) + R$$

where  $R$  is a suitable regularization matrix,  $W = P(\mathbf{w}^{\frac{1}{2}})$  and  $\mathbf{w}$  is the scaling point for  $\mathbf{x}^{(k)}$  and  $\bar{\mathbf{y}}^{(k)}$ .

**Lemma 4.** *Let  $\mathbf{x} \circ \mathbf{y} = \alpha \mathbf{e}$  be a point on the central path for  $\alpha \in (0, 1]$  and let  $\mathbf{w}$  be the scaling point for  $\mathbf{x}$  and  $\mathbf{y}$ . Then the eigenvalues  $\omega_i$ ,  $i = 1, \dots, 3n$  of the automorphism*

$$W = P(\mathbf{w}^{\frac{1}{2}}) \in \mathbb{R}^{3n \times 3n}$$

satisfy

$$\min \omega_i = \mathcal{O}(\sqrt{\alpha}) \quad \text{and} \quad \max \omega_i = \mathcal{O}\left(\frac{1}{\sqrt{\alpha}}\right).$$

*Proof.*

Recall that  $W = P(\mathbf{w}^{\frac{1}{2}}) \in \mathbb{R}^{3n \times 3n}$  is block diagonal with blocks  $W_i = P(\mathbf{w}_i^{\frac{1}{2}}) \in \mathbb{R}^{3 \times 3}$  associated to each contact.

We know from 3(h) that the eigenvalues of  $W_i$  are

$$\begin{aligned} \omega_{i1} \left( P(\mathbf{w}_i^{\frac{1}{2}}) \right) &= \lambda_1(\mathbf{w}_i^{\frac{1}{2}})^2 = \lambda_1(\mathbf{w}_i), \\ \omega_{i2} \left( P(\mathbf{w}_i^{\frac{1}{2}}) \right) &= \lambda_2(\mathbf{w}_i^{\frac{1}{2}})^2 = \lambda_2(\mathbf{w}_i), \\ \omega_{i3} \left( P(\mathbf{w}_i^{\frac{1}{2}}) \right) &= \det(\mathbf{w}_i^{\frac{1}{2}}) = \sqrt{\det(\mathbf{w}_i)}. \end{aligned}$$

By inserting the explicit formula from Lemma 3 we obtain

$$\begin{aligned} \omega_{i1} &= \frac{y_{i\mathbf{n}} + \lambda x_{i\mathbf{n}} - \|\mathbf{y}_{i\mathbf{t}} - \lambda \mathbf{x}_{i\mathbf{t}}\|}{\sqrt{2} \sqrt{\mathbf{x}_i^T \mathbf{y}_i + 2 \sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)}}}, \\ \omega_{i2} &= \frac{y_{i\mathbf{n}} + \lambda x_{i\mathbf{n}} + \|\mathbf{y}_{i\mathbf{t}} - \lambda \mathbf{x}_{i\mathbf{t}}\|}{\sqrt{2} \sqrt{\mathbf{x}_i^T \mathbf{y}_i + 2 \sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)}}}, \\ \omega_{i3} &= \sqrt{\lambda}. \end{aligned}$$

where  $\lambda = \sqrt{\frac{\det(\mathbf{y}_i)}{\det(\mathbf{x}_i)}}$ .

Because of  $\mathbf{x}_i \circ \mathbf{y}_i = \alpha \mathbf{e}$  we know

- $\mathbf{x}_i = \alpha \mathbf{y}_i^{-1} = \frac{\alpha}{\det(\mathbf{y}_i)} J \mathbf{y}_i$ ,
- $2\alpha = \mathbf{x}_i^T \mathbf{y}_i$  and
- $2\sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)} = \mathbf{x}_i^T \mathbf{y}_i$  (with Lemma 1).

Rewriting the equations for  $\omega_{i1}, \omega_{i2}, \omega_{i3}$  using these relations yields

$$\begin{aligned} \omega_{i,1/2} &= \frac{y_{in} + \lambda \frac{\alpha}{\det(\mathbf{y}_i)} y_{in} \mp \|\mathbf{y}_{it} + \lambda \frac{\alpha}{\det(\mathbf{y}_i)} \mathbf{y}_{it}\|}{\sqrt{2}\sqrt{2\alpha + 2\alpha}} \\ &= \left(1 + \alpha \sqrt{\frac{\det(\mathbf{y}_i)}{\det(\mathbf{x}_i) \det(\mathbf{y}_i)^2}}\right) \frac{y_{in} \mp \|\mathbf{y}_{it}\|}{2\sqrt{2}\sqrt{\alpha}} \\ &= \left(1 + \frac{\alpha}{\alpha}\right) \frac{y_{in} \mp \|\mathbf{y}_{it}\|}{2\sqrt{2}\sqrt{\alpha}} \\ &= \frac{1}{\sqrt{\alpha}} \frac{y_{in} \mp \|\mathbf{y}_{it}\|}{\sqrt{2}} \\ \omega_{i3} &= \sqrt{\lambda} = \sqrt{\sqrt{\frac{\det(\mathbf{y}_i)}{\det(\mathbf{x}_i)}}} \\ &= \sqrt{\det(\mathbf{y}_i) \frac{1}{\sqrt{\det(\mathbf{x}_i) \det(\mathbf{y}_i)}}} \\ &= \sqrt{\frac{\det(\mathbf{y}_i)}{\alpha}}. \end{aligned}$$

Analogously by using  $\mathbf{y}_i = \alpha \mathbf{x}_i^{-1}$  we can calculate

$$\begin{aligned} \omega_{i,1/2} &= \sqrt{\alpha} \frac{\sqrt{2}}{x_{in} \pm \|\mathbf{x}_{it}\|}, \\ \omega_{i3} &= \sqrt{\frac{\alpha}{\det(\mathbf{x}_i)}}. \end{aligned}$$

Taking the minimum and maximum of  $\omega_{i1}, \omega_{i2}$  and  $\omega_{i3}$  for all  $i = 1, \dots, n$  yields the result.  $\square$

Let the sorted eigenvalues of  $W$  be

$$0 < \omega_1 \leq \omega_2 \leq \dots \leq \omega_{3n},$$

the sorted eigenvalues of  $\nabla F(\mathbf{x}^k) + R$

$$0 < \nu_1 \leq \nu_2 \leq \dots \leq \nu_{3n}$$

and the sorted eigenvalues of  $A$

$$0 < a_1 \leq a_2 \leq \dots \leq a_{3n}.$$

Using Weyl's inequality we can derive bounds for the eigenvalues of  $A$

$$\begin{aligned} 0 < a_{\min} &:= \omega_1^2 + \nu_1 \leq a_1 \\ \text{and } a_n &\leq a_{\max} := \omega_n^2 + \nu_n. \end{aligned} \quad (34)$$

Assume now, that the current iterate  $(\mathbf{x}^{(k)}, \mathbf{y}^{(k)})$  is in a neighborhood of a point on the central path with a sufficiently small value  $\alpha > 0$ . Then

$$a_{\min} = \mathcal{O}(\rho_{\min}) \quad \text{and} \quad a_{\max} = \mathcal{O}(\alpha^{-1})$$

where  $\rho_{\min}$  is the smallest regularization parameter. Thus the condition of the system matrix satisfies

$$\kappa_A = \mathcal{O}\left(\frac{1}{\rho_{\min} \cdot \alpha}\right).$$

Note, that without regularization, the lower bound on the eigenvalues of  $A$  would be given by  $a_{\min} = \alpha$  because  $\nu_1$ , as the smallest singular value of  $\nabla F(\mathbf{x}^k)$ , is zero in all interesting cases. Without regularization the condition of  $A$  would be  $\mathcal{O}(\alpha^{-2})$ .

Sufficiently large regularization bounds the smallest eigenvalues away from zero. Our expectation on a preconditioner is that the range of eigenvalues is reduced substantially.

We conclude the description of the Interior Point Method with a pseudo-code for every time step of a simulation in Algorithm 1.

## 5. Numerical Tests

We implement the Interior Point Method in C++, making use of the PETSc library for Krylov solvers (Balay et al., 2013). In this section we compare different preconditioners and iterative linear solvers for the Newton step in each iteration. All system matrices are explicitly constructed in a standard sparse matrix structure and no parallelization is used so far. Once a choice for a solution technique is made, this specific method will be optimized in a future task.

### 5.1. Test Problems and Solver Setup

Our first benchmark is one time step from a simulation of a pile of 2048 non-rotational spheres, see Figure 7(a). The spheres have radii between 8 mm and 16 mm. With  $n = 8378$  potential contacts between pairs of spheres there are 25135 unknowns to the Cone Complementarity Problem (21). It will be called Test Problem 1. Test Problem 2 is a similar pile, with 5040 non-rotational spheres, see Figure 7(b). There are  $n = 21052$  potential contacts and thus 63157 unknowns to (21). The time step size is  $\Delta t = 0.01$  s in all test cases.

For the analysis in this paper, we ignore the small term  $\tilde{\mathbf{r}}(\boldsymbol{\lambda})$  from the end of Section 2.4 and we use the same frictional coefficient  $\mu = \mu_i = 0.4$  for all contacts  $i = 1, \dots, n$ . Therefore,  $\nabla F(\mathbf{x}) = N$  is constant and symmetric. We use the same starting value  $\mathbf{x}_i = (0.1, 0, 0)^T \in \text{int } C$  for all contacts. Recall that we have freedom in the choice of the initial value for  $\alpha$ . In our experience,

$$\alpha = \sum_{i=1, \dots, n} \frac{|\mathbf{x}_i^{(0)T} \mathbf{y}_i^{(0)}|}{2n}$$

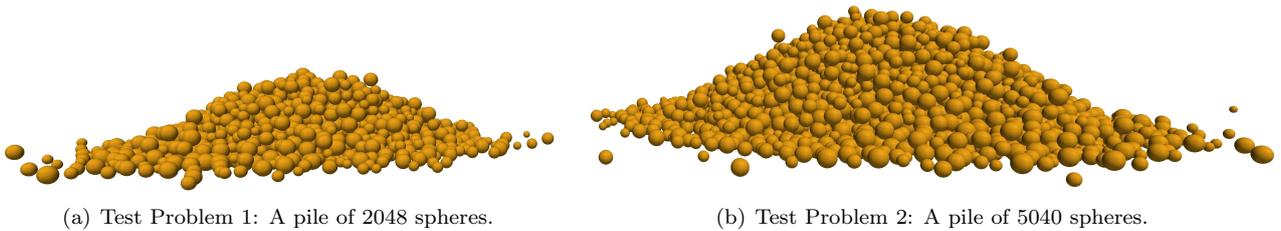

Figure 7: Two Test Problems.

is appropriate.

After every IPM iteration, the new value for  $\alpha$  is chosen based on the value of  $f_{cen}$ . We do this in accordance with (Kojima et al., 1991) by writing

$$\alpha = \beta \frac{\mathbf{x}^T \bar{\mathbf{y}}}{2n}.$$

where

$$\beta = \begin{cases} \beta_{cen}, & \text{if } f_{cen}(\tilde{\mathbf{x}}, \tilde{\mathbf{y}}) \leq \alpha_{cen}, \\ \beta_1, & \text{if } \alpha_{cen} < f_{cen}(\tilde{\mathbf{x}}, \tilde{\mathbf{y}}) \leq \alpha_1, \\ \beta_{bd}, & \text{if } \alpha_1 < f_{cen}(\tilde{\mathbf{x}}, \tilde{\mathbf{y}}). \end{cases}$$

In all tests we use the bounds  $\alpha_{cen} = 0.1$  and  $\alpha_1 = 1$  for the centralizing function  $f_{cen}$ . We test an aggressive choice  $\beta_{cen} = 0.01$ ,  $\beta_1 = 0.1$  and  $\beta_{bd} = 0.5$  and compare it to a more cautious strategy using  $\beta_{cen} = 0.1$ ,  $\beta_1 = 0.5$  and  $\beta_{bd} = 1$ . The aggressive choice follows the spirit of potential reduction algorithms, while the more cautious strategy tries to stay as central as possible, and hence it behaves like a path-following algorithm.

## 5.2. Test Studies

First, we analyze how regularization and preconditioning effects the condition of the Matrix  $A$ . Next, we study different Krylov methods to solve the linear subproblems. We shortly compare the previously stated aggressive choice of  $\beta$  to the more conservative one. Finally, we compare the presented IPM to the Projected Gauß–Jacobi Method and study its convergence behavior for different problem sizes.

### 5.2.1. Regularization and Preconditioning

In this section we examine numerically how regularization and preconditioning influence the linear systems. Incomplete Cholesky (IC(0)) and Incomplete LU (ILU(0)) factorizations are considered as preconditioners, see (Saad, 2003) for details.

Figure 8 shows approximations for the range of eigenvalues of the linear systems in every IPM iteration applied to Test Problem 1. The system matrices are calculated using algorithm 1, where the linear systems are directly solved using an LU factorization.

As expected, in the non-regularized and non-preconditioned case, the condition grows quadratically as  $\alpha$  tends towards zero. With regularization, the smallest eigenvalue of the regularized matrix  $N + R$  stays bounded,

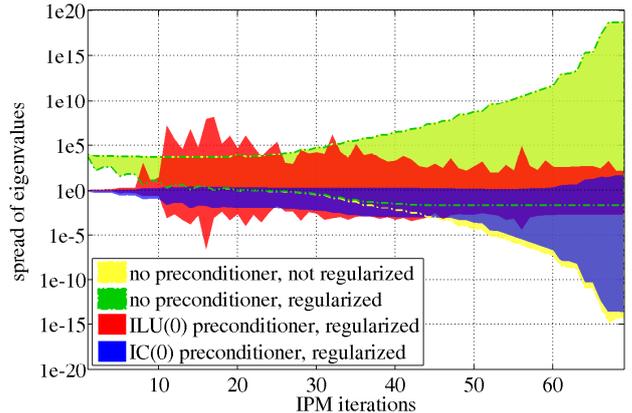

Figure 8: The spread of eigenvalues of the linear systems for Test Problem 1.

while the smallest eigenvalue of  $W = P(\mathbf{w})$  approaches zero. Thus, for sufficiently small  $\alpha$ , regularization bounds the smallest eigenvalue of  $A = W + N + R$  away from zero.

The effect of the preconditioners is surprising, however. IC(0) very effectively reduces the range of eigenvalues in the first few iterations. Yet close to the exact solution, the preconditioned system is not much better than the regularized non-preconditioned system. ILU(0), on the other hand, actually worsens the conditions of the systems between the 10th and the 40th iteration. Towards the exact solution, the eigenvalues are nicely clustered around one. In fact, all Krylov methods tested by us fail between the 10th and 16th iteration if the systems are preconditioned with ILU(0) or ILU(1): The preconditioners are indefinite and the inaccuracy of the solution of the linear system causes the maximum step size  $\theta$  to converge to zero.

This result implies that, if a very high accuracy is required, it might make sense to switch to ILU(0) closer to the optimal solution after using IC(0) as an initial preconditioner. Yet, all our tests fail because ILU(0) is always indefinite after switching the preconditioner. In addition, there is no intuitive criterion to decide when to switch the preconditioners.

In conclusion, IC(0) is the more stable choice even though the decrease in the range of eigenvalues close to optimality is better with ILU(0).

### 5.2.2. Krylov Solvers

Next, we test the performance of Krylov solvers applied to the preconditioned system. We use the cautious choice for  $\beta$ , i.e. the path-following strategy, for these tests. We consider the Generalized Minimum Residual Method (GMinres), the Conjugate Gradient (CG) method and the stabilized Bi-Conjugate Gradient (BiCGstab) method. IC(0) will serve as a preconditioner. The maximum number of Krylov iterations is set to 500 and we perform 100 outer IPM iterations. We only stop the IPM before the maximum number of outer iterations is reached, if the step size  $\theta$  falls below a predefined threshold.

We compare the methods with regards to calculation time and the value of the cost function

$$\text{cost}(\boldsymbol{\lambda}, \mathbf{u}) = |\boldsymbol{\lambda}^T \mathbf{u}|/n,$$

where  $\boldsymbol{\lambda}$  and  $\mathbf{u}$  are as defined in Section 2 and  $n$  is the number of contacts. Note, that for the optimum we have

$$\text{cost}(\boldsymbol{\lambda}^*, \mathbf{u}^*) = 0.$$

In addition, we test the feasibility  $\boldsymbol{\lambda} \in \mathcal{K}_\mu$  and  $\mathbf{u} \in \mathcal{K}_\mu^*$  using the functions

$$feas(\boldsymbol{\lambda}, \mathbf{u}) = \max_{i=1, \dots, n} (\max(f_u(\mathbf{u}_i), f_\lambda(\lambda_i)))$$

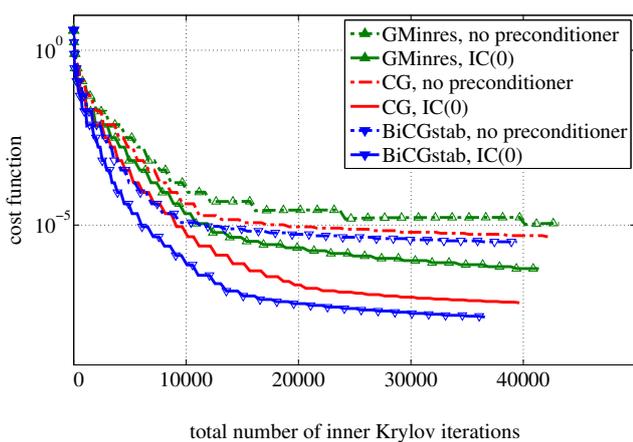

and

$$\begin{aligned} f_u(\mathbf{u}_i) &= -\min(0, u_{i\text{in}} - \mu_i \|\mathbf{u}_{i\text{t}}\|) \quad \text{and} \\ f_\lambda(\lambda_i) &= -\min(0, \mu_i \lambda_{i\text{in}} - \|\lambda_{i\text{t}}\|). \end{aligned}$$

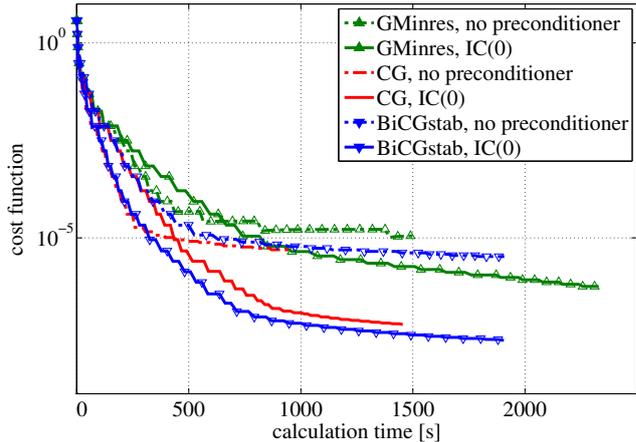

Figure 9 presents convergence plots for Test Problem 2. Figure 9(a) depicts the cost function value over the total number of inner Krylov iterations. While the linear solves from the first few iterations are always cheap, the maximum number of 500 Krylov iterations is reached during all later IPM iterations. In theory, IPMs converge super-linearly. Not surprisingly, using an inexact linear solver reduces the rate of convergence. This has two reasons. Firstly, the condition of the matrices deteriorates close to optimality. Secondly, as the error of the CCP decreases, the accuracy requirements for the linear solvers increase: The residual of the linear problem has to be of some orders of magnitude smaller than the current error of the CCP. Otherwise we cannot expect the error to decrease any further.

We learn from 9(a) that BiCGstab delivers the smallest error in the fewest number of inner iterations. Figure 9(b) shows that, if the accuracy requirements are not too high, preconditioning can be skipped altogether when using CG. This fits to our findings from the previous section, that IC(0) is not necessarily better than the not preconditioned regularized system close to optimality.

We observe for all calculations that, initially, the feasibility error decreases with a comparable rate as the cost function. Then, it drops suddenly from around  $10^{-1.3}$  to zero by the 19th IPM iteration for all Krylov solvers and the algorithm switches to a feasible Interior Point Method.

(a) cost function value over number of inner Krylov iterations.

(b) cost function value over calculation time.

Figure 9: Comparison of different Krylov Solvers.

### 5.2.3. Path-following vs. Potential Reduction

In this section we compare the path-following method ( $\beta_{cen} = 0.1$ ,  $\beta_1 = 0.5$ ,  $\beta_{bd} = 1.0$ ) to the potential reduction technique ( $\beta_{cen} = 0.01$ ,  $\beta_1 = 0.1$ ,  $\beta_{bd} = 0.5$ ) applied to Test Problem 2.

Figure 10 shows the convergence behavior of the two approaches. Figure 10(a) shows that the more aggressive potential reduction scheme reduces the error faster than the path-following scheme, regardless of whether a direct solver or a Krylov method is used. When we use BiCGstab as the linear solver, the step size  $\theta$  converges to zero quickly and we are forced to stop after around 30 iterations. This is not the case for path-following, but the convergence rate decreases after 50 iterations. Figure 10(a) also shows that, if the linear systems are solved accurately, the error is reduced to machine precision at a constant rate, both for path-following and potential reduction.

Figure 10(b) compares the two techniques in terms of calculation time. Path-following allows larger step sizes  $\theta$  and the linear solvers close to the central path seem to be better conditioned, so that in total less inner Krylov iterations are needed. Therefore, if the IPM is combined with an inexact linear solver, the more conservative path-following method converges faster than potential reduction.

### 5.2.4. Comparison to PGJ

As a final test, we compare the IPM to PGJ in terms of accuracy. We use the path-following strategy, IC(0) as a preconditioner and BiCGstab as a solver. The IPM decreases the cost function at about the same rate as it decreases the feasibility error. In our experience, PGJ reduces the cost function much faster than the feasibility error. To compare the methods more easily, we examine them in terms of the error

$$error(\lambda, \mathbf{u}) = \max(cost(\lambda, \mathbf{u}), feas(\lambda, \mathbf{u})),$$

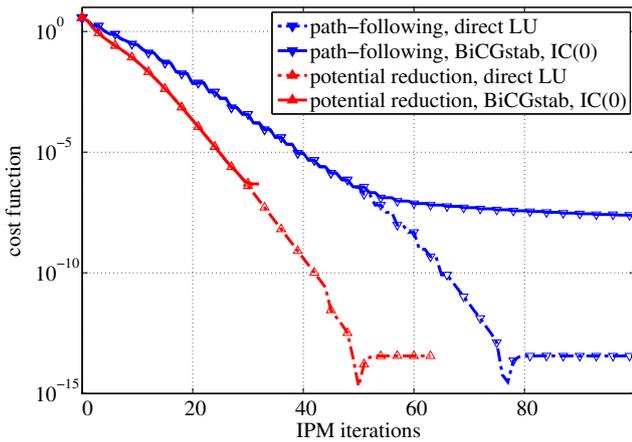

where the functions  $cost$  and  $feas$  are the same as in Section 5.2.2.

Figure 11(a) shows the convergence of PGJ and IPM for both test cases. PGJ struggles specifically with larger problems, its convergence rate stalls almost completely before a reasonably small error is achieved. The convergence rate of IPM, on the other hand, decreases slowly with the problem size. For Test Problem 2, PGJ requires about 43000 iterations to reduce the error below  $10^{-3}$ . The Interior Point Method requires a total of around 2545 Krylov iterations and a little more than a fifth of the calculation time for the same accuracy. From Figure 11(b) we learn that the decrease in the convergence rate of the IPM is almost entirely due to the inaccuracy of the linear solves. We see the error plotted over the number of outer IPM iterations when a direct solver is used. The number of outer IPM iterations needed to achieve a certain accuracy are nearly the same for both test problems.

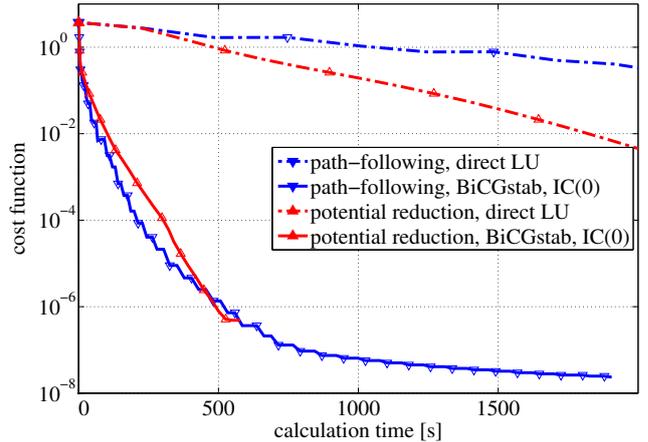

IPM scales better with the problem size than PGJ does and achieves a smaller error for both test cases. The scalability of the IPM with the problem size depends almost entirely on the scalability of the linear solver.

## 6. Conclusion

We conclude, that the presented IPM is well-suited to solve the CCP to a higher accuracy than PGJ. With a direct solver, IPM converges with a constant rate until machine precision is reached. Since the IPM scales with the number of particles just as well as the linear solvers do, a direct solver cannot be applied in reasonable time for large scale problems. We tested three different Krylov solvers and two preconditioners and found that regularizing the subsystems, preconditioning them with Incomplete Cholesky factorizations and solving them with BiCGstab gives the fastest convergence. The inaccuracy of the linear solves decreases the overall convergence rate of the

(b) cost function value over calculation time.

Figure 10: Path-Following vs. Potential Reduction.

(a) error value over calculation time.

(b) cost function value over IPM iterations.

Figure 11: The convergence of PGJ and IPM for different problem sizes.

IPM, but the inexact IPM still produces smaller errors than PGJ. IPMs superiority over PGJ becomes especially clear as the problem size increases.

We also found that, towards the exact solution,  $IC(0)$  does not decrease the range of eigenvalues much further than plain regularization does. The rate of convergence of the IPM and its calculation time depend highly on the efficiency of the preconditioner and the linear solver. While the method has shown its potential,  $IC(0)$  and BiCGstab still require a large number of iterations and the calculation time is higher than desirable.

In the future, the highest priority is to further analyze different preconditioners. Possibly there are problem-related ways to improve the numerical properties of the linear systems, either by taking advantage of the physical model or by manipulating the Interior Point Method itself. State-of-the-art linear solvers such as Algebraic Multigrid Methods could be applied if the accuracy requirement is very high. Once it is clear which solution technique fits best into the IPM framework, there are a lot of further

optimizations to think of. One could start solving the CCP using PGJ and once the convergence rate decreases, the PGJ solution can be used to construct a good starting value for the IPM. Similarly, one could exploit the fact that the linear systems behave nicely in the first few IPM iterations. Hence, a simple and cheap linear solver suffices. As the error decreases it might make sense to switch to a more powerful solver. Ideally, the linear solvers should lend themselves for a matrix-free implementation and they should be parallelizable.

For the prediction of draft forces from the interaction of an excavator with soil, we have to demand very high standards from the simulation method. It has to be stable, accurate and it should be able to run a simulation in a reasonably short amount of time. So far, neither DEM nor NSCD are entirely satisfactory: One method is accurate, but unstable and slow; while the other is reasonably fast and stable, but inaccurate. In this paper, we use results from abstract algebra, convex analysis, measure theory, optimization, nonlinear programming and numerics to im-

prove the accuracy of NSCD. So far, the presented Interior Point Method is little more than a prototype, but it is already substantially more accurate than PGJ and leaves a lot of room for further development.

## 66. F. Gaspar, O. Iliev, F. Lisbona, A. Naumovich, P. Vabishchevich

### **On numerical solution of 1-D poroelasticity equations in a multilayered domain**

Keywords: poroelasticity, multilayered material, finite volume discretization, MAC type grid (41 pages, 2004)

## 67. J. Ohser, K. Schladitz, K. Koch, M. Nöthe **Diffraction by image processing and its application in materials science**

Keywords: porous microstructure, image analysis, random set, fast Fourier transform, power spectrum, Bartlett spectrum (13 pages, 2004)

## 68. H. Neunzert **Mathematics as a Technology: Challenges for the next 10 Years**

Keywords: applied mathematics, technology, modelling, simulation, visualization, optimization, glass processing, spinning processes, fiber-fluid interaction, turbulence effects, topological optimization, multicriteria optimization, Uncertainty and Risk, financial mathematics, Malliavin calculus, Monte-Carlo methods, virtual material design, filtration, bio-informatics, system biology (29 pages, 2004)

## 69. R. Ewing, O. Iliev, R. Lazarov, A. Naumovich **On convergence of certain finite difference discretizations for 1D poroelasticity interface problems**

Keywords: poroelasticity, multilayered material, finite volume discretizations, MAC type grid, error estimates (26 pages, 2004)

## 70. W. Dörfler, O. Iliev, D. Stoyanov, D. Vassileva **On Efficient Simulation of Non-Newtonian Flow in Saturated Porous Media with a Multigrid Adaptive Refinement Solver**

Keywords: Nonlinear multigrid, adaptive refinement, non-Newtonian in porous media (25 pages, 2004)

## 71. J. Kalcsics, S. Nickel, M. Schröder **Towards a Unified Territory Design Approach – Applications, Algorithms and GIS Integration**

Keywords: territory design, political districting, sales territory alignment, optimization algorithms, Geographical Information Systems (40 pages, 2005)

## 72. K. Schladitz, S. Peters, D. Reinel-Bitzer, A. Wiegmann, J. Ohser **Design of acoustic trim based on geometric modeling and flow simulation for non-woven**

Keywords: random system of fibers, Poisson line process, flow resistivity, acoustic absorption, Lattice-Boltzmann method, non-woven (21 pages, 2005)

## 73. V. Rutka, A. Wiegmann **Explicit Jump Immersed Interface Method for virtual material design of the effective elastic moduli of composite materials**

Keywords: virtual material design, explicit jump immersed interface method, effective elastic moduli, composite materials (22 pages, 2005)

## 74. T. Hanne **Eine Übersicht zum Scheduling von Baustellen**

Keywords: Projektplanung, Scheduling, Bauplanung, Bauindustrie (32 pages, 2005)

## 75. J. Linn **The Folgar-Tucker Model as a Differential Algebraic System for Fiber Orientation Calculation**

Keywords: fiber orientation, Folgar-Tucker model, invariants, algebraic constraints, phase space, trace stability (15 pages, 2005)

## 76. M. Speckert, K. Dreßler, H. Mauch, A. Lion, G. J. Wierda **Simulation eines neuartigen Prüfsystems für Achserproben durch MKS-Modellierung einschließlich Regelung**

Keywords: virtual test rig, suspension testing, multibody simulation, modeling hexapod test rig, optimization of test rig configuration (20 pages, 2005)

## 77. K.-H. Küfer, M. Monz, A. Scherrer, P. Süß, F. Alonso, A. S. A. Sultan, Th. Bortfeld, D. Craft, Chr. Thieke **Multicriteria optimization in intensity modulated radiotherapy planning**

Keywords: multicriteria optimization, extreme solutions, real-time decision making, adaptive approximation schemes, clustering methods, IMRT planning, reverse engineering (51 pages, 2005)

## 78. S. Amstutz, H. Andrä **A new algorithm for topology optimization using a level-set method**

Keywords: shape optimization, topology optimization, topological sensitivity, level-set (22 pages, 2005)

## 79. N. Ettrich **Generation of surface elevation models for urban drainage simulation**

Keywords: Flooding, simulation, urban elevation models, laser scanning (22 pages, 2005)

## 80. H. Andrä, J. Linn, I. Matej, I. Shklyar, K. Steiner, E. Teichmann **OPTCAST – Entwicklung adäquater Strukturoptimierungsverfahren für Gießereien Technischer Bericht (KURZFASSUNG)**

Keywords: Topologieoptimierung, Level-Set-Methode, Gießprozesssimulation, Gießtechnische Restriktionen, CAE-Kette zur Strukturoptimierung (77 pages, 2005)

## 81. N. Marheineke, R. Wegener **Fiber Dynamics in Turbulent Flows Part I: General Modeling Framework**

Keywords: fiber-fluid interaction; Cosserat rod; turbulence modeling; Kolmogorov's energy spectrum; double-velocity correlations; differentiable Gaussian fields (20 pages, 2005)

### **Part II: Specific Taylor Drag**

Keywords: flexible fibers;  $k-\epsilon$  turbulence model; fiber-turbulence interaction scales; air drag; random Gaussian aerodynamic force; white noise; stochastic differential equations; ARMA process (18 pages, 2005)

## 82. C. H. Lampert, O. Wirjadi **An Optimal Non-Orthogonal Separation of the Anisotropic Gaussian Convolution Filter**

Keywords: Anisotropic Gaussian filter, linear filtering, orientation space, nD image processing, separable filters (25 pages, 2005)

## 83. H. Andrä, D. Stoyanov **Error indicators in the parallel finite element solver for linear elasticity DDFEM**

Keywords: linear elasticity, finite element method, hierarchical shape functions, domain decom-position, parallel implementation, a posteriori error estimates (21 pages, 2006)

## 84. M. Schröder, I. Solchenbach **Optimization of Transfer Quality in Regional Public Transit**

Keywords: public transit, transfer quality, quadratic assignment problem (16 pages, 2006)

## 85. A. Naumovich, F. J. Gaspar **On a multigrid solver for the three-dimensional Biot poroelasticity system in multilayered domains**

Keywords: poroelasticity, interface problem, multigrid, operator-dependent prolongation (11 pages, 2006)

## 86. S. Panda, R. Wegener, N. Marheineke **Slender Body Theory for the Dynamics of Curved Viscous Fibers**

Keywords: curved viscous fibers; fluid dynamics; Navier-Stokes equations; free boundary value problem; asymptotic expansions; slender body theory (14 pages, 2006)

## 87. E. Ivanov, H. Andrä, A. Kudryavtsev **Domain Decomposition Approach for Automatic Parallel Generation of Tetrahedral Grids**

Keywords: Grid Generation, Unstructured Grid, Delaunay Triangulation, Parallel Programming, Domain Decomposition, Load Balancing (18 pages, 2006)

## 88. S. Tiwari, S. Antonov, D. Hietel, J. Kuhnert, R. Wegener

### **A Meshfree Method for Simulations of Interactions between Fluids and Flexible Structures**

Keywords: Meshfree Method, FPM, Fluid Structure Interaction, Sheet of Paper, Dynamical Coupling (16 pages, 2006)

## 89. R. Ciegis, O. Iliev, V. Starikovicius, K. Steiner **Numerical Algorithms for Solving Problems of Multiphase Flows in Porous Media**

Keywords: nonlinear algorithms, finite-volume method, software tools, porous media, flows (16 pages, 2006)

90. D. Niedziela, O. Iliev, A. Latz  
**On 3D Numerical Simulations of Viscoelastic Fluids**

Keywords: non-Newtonian fluids, anisotropic viscosity, integral constitutive equation (18 pages, 2006)

91. A. Winterfeld  
**Application of general semi-infinite Programming to Lapidary Cutting Problems**

Keywords: large scale optimization, nonlinear programming, general semi-infinite optimization, design centering, clustering (26 pages, 2006)

92. J. Orlik, A. Ostrovska  
**Space-Time Finite Element Approximation and Numerical Solution of Hereditary Linear Viscoelasticity Problems**

Keywords: hereditary viscoelasticity; kern approximation by interpolation; space-time finite element approximation, stability and a priori estimate (24 pages, 2006)

93. V. Rutka, A. Wiegmann, H. Andrä  
**EJIM for Calculation of effective Elastic Moduli in 3D Linear Elasticity**

Keywords: Elliptic PDE, linear elasticity, irregular domain, finite differences, fast solvers, effective elastic moduli (24 pages, 2006)

94. A. Wiegmann, A. Zemitis  
**EJ-HEAT: A Fast Explicit Jump Harmonic Averaging Solver for the Effective Heat Conductivity of Composite Materials**

Keywords: Stationary heat equation, effective thermal conductivity, explicit jump, discontinuous coefficients, virtual material design, microstructure simulation, EJ-HEAT (21 pages, 2006)

95. A. Naumovich  
**On a finite volume discretization of the three-dimensional Biot poroelasticity system in multilayered domains**

Keywords: Biot poroelasticity system, interface problems, finite volume discretization, finite difference method (21 pages, 2006)

96. M. Krekel, J. Wenzel  
**A unified approach to Credit Default Swap and Constant Maturity Credit Default Swap valuation**

Keywords: LIBOR market model, credit risk, Credit Default Swaption, Constant Maturity Credit Default Swap method (43 pages, 2006)

97. A. Dreyer  
**Interval Methods for Analog Circuits**

Keywords: interval arithmetic, analog circuits, tolerance analysis, parametric linear systems, frequency response, symbolic analysis, CAD, computer algebra (36 pages, 2006)

98. N. Weigel, S. Weihe, G. Bitsch, K. Dreßler  
**Usage of Simulation for Design and Optimization of Testing**

Keywords: Vehicle test rigs, MBS, control, hydraulics, testing philosophy (14 pages, 2006)

99. H. Lang, G. Bitsch, K. Dreßler, M. Speckert  
**Comparison of the solutions of the elastic and elastoplastic boundary value problems**

Keywords: Elastic BVP, elastoplastic BVP, variational inequalities, rate-independency, hysteresis, linear kinematic hardening, stop- and play-operator (21 pages, 2006)

100. M. Speckert, K. Dreßler, H. Mauch  
**MBS Simulation of a hexapod based suspension test rig**

Keywords: Test rig, MBS simulation, suspension, hydraulics, controlling, design optimization (12 pages, 2006)

101. S. Azizi Sultan, K.-H. Küfer  
**A dynamic algorithm for beam orientations in multicriteria IMRT planning**

Keywords: radiotherapy planning, beam orientation optimization, dynamic approach, evolutionary algorithm, global optimization (14 pages, 2006)

102. T. Götz, A. Klar, N. Marheineke, R. Wegener  
**A Stochastic Model for the Fiber Lay-down Process in the Nonwoven Production**

Keywords: fiber dynamics, stochastic Hamiltonian system, stochastic averaging (17 pages, 2006)

103. Ph. Süß, K.-H. Küfer  
**Balancing control and simplicity: a variable aggregation method in intensity modulated radiation therapy planning**

Keywords: IMRT planning, variable aggregation, clustering methods (22 pages, 2006)

104. A. Beaudry, G. Laporte, T. Melo, S. Nickel  
**Dynamic transportation of patients in hospitals**

Keywords: in-house hospital transportation, dial-a-ride, dynamic mode, tabu search (37 pages, 2006)

105. Th. Hanne  
**Applying multiobjective evolutionary algorithms in industrial projects**

Keywords: multiobjective evolutionary algorithms, discrete optimization, continuous optimization, electronic circuit design, semi-infinite programming, scheduling (18 pages, 2006)

106. J. Franke, S. Halim  
**Wild bootstrap tests for comparing signals and images**

Keywords: wild bootstrap test, texture classification, textile quality control, defect detection, kernel estimate, nonparametric regression (13 pages, 2007)

107. Z. Drezner, S. Nickel  
**Solving the ordered one-median problem in the plane**

Keywords: planar location, global optimization, ordered median, big triangle small triangle method, bounds, numerical experiments (21 pages, 2007)

108. Th. Götz, A. Klar, A. Unterreiter, R. Wegener  
**Numerical evidence for the non-existing of solutions of the equations describing rotational fiber spinning**

Keywords: rotational fiber spinning, viscous fibers, boundary value problem, existence of solutions (11 pages, 2007)

109. Ph. Süß, K.-H. Küfer  
**Smooth intensity maps and the Bortfeld-Boyer sequencer**

Keywords: probabilistic analysis, intensity modulated radiotherapy treatment (IMRT), IMRT plan application, step-and-shoot sequencing (8 pages, 2007)

110. E. Ivanov, O. Gluchshenko, H. Andrä, A. Kudryavtsev  
**Parallel software tool for decomposing and meshing of 3d structures**

Keywords: a-priori domain decomposition, unstructured grid, Delaunay mesh generation (14 pages, 2007)

111. O. Iliev, R. Lazarov, J. Willems  
**Numerical study of two-grid preconditioners for 1d elliptic problems with highly oscillating discontinuous coefficients**

Keywords: two-grid algorithm, oscillating coefficients, preconditioner (20 pages, 2007)

112. L. Bonilla, T. Götz, A. Klar, N. Marheineke, R. Wegener  
**Hydrodynamic limit of the Fokker-Planck equation describing fiber lay-down processes**

Keywords: stochastic differential equations, Fokker-Planck equation, asymptotic expansion, Ornstein-Uhlenbeck process (17 pages, 2007)

113. S. Rief  
**Modeling and simulation of the pressing section of a paper machine**

Keywords: paper machine, computational fluid dynamics, porous media (41 pages, 2007)

114. R. Ciegis, O. Iliev, Z. Lakdawala  
**On parallel numerical algorithms for simulating industrial filtration problems**

Keywords: Navier-Stokes-Brinkmann equations, finite volume discretization method, SIMPLE, parallel computing, data decomposition method (24 pages, 2007)

115. N. Marheineke, R. Wegener  
**Dynamics of curved viscous fibers with surface tension**

Keywords: Slender body theory, curved viscous fibers with surface tension, free boundary value problem (25 pages, 2007)

116. S. Feth, J. Franke, M. Speckert  
**Resampling-Methoden zur mse-Korrektur und Anwendungen in der Betriebsfestigkeit**

Keywords: Weibull, Bootstrap, Maximum-Likelihood, Betriebsfestigkeit (16 pages, 2007)

117. H. Knaf  
**Kernel Fisher discriminant functions – a concise and rigorous introduction**

Keywords: wild bootstrap test, texture classification, textile quality control, defect detection, kernel estimate, nonparametric regression (30 pages, 2007)

118. O. Iliev, I. Rybak  
**On numerical upscaling for flows in heterogeneous porous media**  
Keywords: numerical upscaling, heterogeneous porous media, single phase flow, Darcy's law, multiscale problem, effective permeability, multipoint flux approximation, anisotropy (17 pages, 2007)
119. O. Iliev, I. Rybak  
**On approximation property of multipoint flux approximation method**  
Keywords: Multipoint flux approximation, finite volume method, elliptic equation, discontinuous tensor coefficients, anisotropy (15 pages, 2007)
120. O. Iliev, I. Rybak, J. Willems  
**On upscaling heat conductivity for a class of industrial problems**  
Keywords: Multiscale problems, effective heat conductivity, numerical upscaling, domain decomposition (21 pages, 2007)
121. R. Ewing, O. Iliev, R. Lazarov, I. Rybak  
**On two-level preconditioners for flow in porous media**  
Keywords: Multiscale problem, Darcy's law, single phase flow, anisotropic heterogeneous porous media, numerical upscaling, multigrid, domain decomposition, efficient preconditioner (18 pages, 2007)
122. M. Brickenstein, A. Dreyer  
**POLYBORI: A Gröbner basis framework for Boolean polynomials**  
Keywords: Gröbner basis, formal verification, Boolean polynomials, algebraic cryptanalysis, satisfiability (23 pages, 2007)
123. O. Wirjadi  
**Survey of 3d image segmentation methods**  
Keywords: image processing, 3d, image segmentation, binarization (20 pages, 2007)
124. S. Zeytun, A. Gupta  
**A Comparative Study of the Vasicek and the CIR Model of the Short Rate**  
Keywords: interest rates, Vasicek model, CIR-model, calibration, parameter estimation (17 pages, 2007)
125. G. Hanselmann, A. Sarishvili  
**Heterogeneous redundancy in software quality prediction using a hybrid Bayesian approach**  
Keywords: reliability prediction, fault prediction, non-homogeneous poisson process, Bayesian model averaging (17 pages, 2007)
126. V. Maag, M. Berger, A. Winterfeld, K.-H. Küfer  
**A novel non-linear approach to minimal area rectangular packing**  
Keywords: rectangular packing, non-overlapping constraints, non-linear optimization, regularization, relaxation (18 pages, 2007)
127. M. Monz, K.-H. Küfer, T. Bortfeld, C. Thieke  
**Pareto navigation – systematic multi-criteria-based IMRT treatment plan determination**  
Keywords: convex, interactive multi-objective optimization, intensity modulated radiotherapy planning (15 pages, 2007)
128. M. Krause, A. Scherrer  
**On the role of modeling parameters in IMRT plan optimization**  
Keywords: intensity-modulated radiotherapy (IMRT), inverse IMRT planning, convex optimization, sensitivity analysis, elasticity, modeling parameters, equivalent uniform dose (EUD) (18 pages, 2007)
129. A. Wiegmann  
**Computation of the permeability of porous materials from their microstructure by FFF-Stokes**  
Keywords: permeability, numerical homogenization, fast Stokes solver (24 pages, 2007)
130. T. Melo, S. Nickel, F. Saldanha da Gama  
**Facility Location and Supply Chain Management – A comprehensive review**  
Keywords: facility location, supply chain management, network design (54 pages, 2007)
131. T. Hanne, T. Melo, S. Nickel  
**Bringing robustness to patient flow management through optimized patient transports in hospitals**  
Keywords: Dial-a-Ride problem, online problem, case study, tabu search, hospital logistics (23 pages, 2007)
132. R. Ewing, O. Iliev, R. Lazarov, I. Rybak, J. Willems  
**An efficient approach for upscaling properties of composite materials with high contrast of coefficients**  
Keywords: effective heat conductivity, permeability of fractured porous media, numerical upscaling, fibrous insulation materials, metal foams (16 pages, 2008)
133. S. Gelareh, S. Nickel  
**New approaches to hub location problems in public transport planning**  
Keywords: integer programming, hub location, transportation, decomposition, heuristic (25 pages, 2008)
134. G. Thömmes, J. Becker, M. Junk, A. K. Vaidantam, D. Kehrwald, A. Klar, K. Steiner, A. Wiegmann  
**A Lattice Boltzmann Method for immiscible multiphase flow simulations using the Level Set Method**  
Keywords: Lattice Boltzmann method, Level Set method, free surface, multiphase flow (28 pages, 2008)
135. J. Orlik  
**Homogenization in elasto-plasticity**  
Keywords: multiscale structures, asymptotic homogenization, nonlinear energy (40 pages, 2008)
136. J. Almquist, H. Schmidt, P. Lang, J. Deitmer, M. Jirstrand, D. Prätzel-Wolters, H. Becker  
**Determination of interaction between MCT1 and CAII via a mathematical and physiological approach**  
Keywords: mathematical modeling; model reduction; electrophysiology; pH-sensitive microelectrodes; proton antenna (20 pages, 2008)
137. E. Savenkov, H. Andrä, O. Iliev  
**An analysis of one regularization approach for solution of pure Neumann problem**  
Keywords: pure Neumann problem, elasticity, regularization, finite element method, condition number (27 pages, 2008)
138. O. Berman, J. Kalcsics, D. Krass, S. Nickel  
**The ordered gradual covering location problem on a network**  
Keywords: gradual covering, ordered median function, network location (32 pages, 2008)
139. S. Gelareh, S. Nickel  
**Multi-period public transport design: A novel model and solution approaches**  
Keywords: Integer programming, hub location, public transport, multi-period planning, heuristics (31 pages, 2008)
140. T. Melo, S. Nickel, F. Saldanha-da-Gama  
**Network design decisions in supply chain planning**  
Keywords: supply chain design, integer programming models, location models, heuristics (20 pages, 2008)
141. C. Lautensack, A. Särkkä, J. Freitag, K. Schladitz  
**Anisotropy analysis of pressed point processes**  
Keywords: estimation of compression, isotropy test, nearest neighbour distance, orientation analysis, polar ice, Ripley's K function (35 pages, 2008)
142. O. Iliev, R. Lazarov, J. Willems  
**A Graph-Laplacian approach for calculating the effective thermal conductivity of complicated fiber geometries**  
Keywords: graph laplacian, effective heat conductivity, numerical upscaling, fibrous materials (14 pages, 2008)
143. J. Linn, T. Stephan, J. Carlsson, R. Bohlin  
**Fast simulation of quasistatic rod deformations for VR applications**  
Keywords: quasistatic deformations, geometrically exact rod models, variational formulation, energy minimization, finite differences, nonlinear conjugate gradients (7 pages, 2008)
144. J. Linn, T. Stephan  
**Simulation of quasistatic deformations using discrete rod models**  
Keywords: quasistatic deformations, geometrically exact rod models, variational formulation, energy minimization, finite differences, nonlinear conjugate gradients (9 pages, 2008)
145. J. Marburger, N. Marheineke, R. Pinnau  
**Adjoint based optimal control using mesh-less discretizations**  
Keywords: Mesh-less methods, particle methods, Eulerian-Lagrangian formulation, optimization strategies, adjoint method, hyperbolic equations (14 pages, 2008)

146. S. Desmetre, J. Gould, A. Szimayer  
**Own-company stockholding and work effort preferences of an unconstrained executive**  
Keywords: optimal portfolio choice, executive compensation  
(33 pages, 2008)
147. M. Berger, M. Schröder, K.-H. Küfer  
**A constraint programming approach for the two-dimensional rectangular packing problem with orthogonal orientations**  
Keywords: rectangular packing, orthogonal orientations non-overlapping constraints, constraint propagation  
(13 pages, 2008)
148. K. Schladitz, C. Redenbach, T. Sych, M. Godehardt  
**Microstructural characterisation of open foams using 3d images**  
Keywords: virtual material design, image analysis, open foams  
(30 pages, 2008)
149. E. Fernández, J. Kalcsics, S. Nickel, R. Ríos-Mercado  
**A novel territory design model arising in the implementation of the WEEE-Directive**  
Keywords: heuristics, optimization, logistics, recycling  
(28 pages, 2008)
150. H. Lang, J. Linn  
**Lagrangian field theory in space-time for geometrically exact Cosserat rods**  
Keywords: Cosserat rods, geometrically exact rods, small strain, large deformation, deformable bodies, Lagrangian field theory, variational calculus  
(19 pages, 2009)
151. K. Dreßler, M. Speckert, R. Müller, Ch. Weber  
**Customer loads correlation in truck engineering**  
Keywords: Customer distribution, safety critical components, quantile estimation, Monte-Carlo methods  
(11 pages, 2009)
152. H. Lang, K. Dreßler  
**An improved multi-axial stress-strain correction model for elastic FE postprocessing**  
Keywords: Jiang's model of elastoplasticity, stress-strain correction, parameter identification, automatic differentiation, least-squares optimization, Coleman-Li algorithm  
(6 pages, 2009)
153. J. Kalcsics, S. Nickel, M. Schröder  
**A generic geometric approach to territory design and districting**  
Keywords: Territory design, districting, combinatorial optimization, heuristics, computational geometry  
(32 pages, 2009)
154. Th. Fütterer, A. Klar, R. Wegener  
**An energy conserving numerical scheme for the dynamics of hyperelastic rods**  
Keywords: Cosserat rod, hyperelastic, energy conservation, finite differences  
(16 pages, 2009)
155. A. Wiegmann, L. Cheng, E. Glatt, O. Iliev, S. Rief  
**Design of pleated filters by computer simulations**  
Keywords: Solid-gas separation, solid-liquid separation, pleated filter, design, simulation  
(21 pages, 2009)
156. A. Klar, N. Marheineke, R. Wegener  
**Hierarchy of mathematical models for production processes of technical textiles**  
Keywords: Fiber-fluid interaction, slender-body theory, turbulence modeling, model reduction, stochastic differential equations, Fokker-Planck equation, asymptotic expansions, parameter identification  
(21 pages, 2009)
157. E. Glatt, S. Rief, A. Wiegmann, M. Knefel, E. Wegenke  
**Structure and pressure drop of real and virtual metal wire meshes**  
Keywords: metal wire mesh, structure simulation, model calibration, CFD simulation, pressure loss  
(7 pages, 2009)
158. S. Kruse, M. Müller  
**Pricing American call options under the assumption of stochastic dividends – An application of the Korn-Rogers model**  
Keywords: option pricing, American options, dividends, dividend discount model, Black-Scholes model  
(22 pages, 2009)
159. H. Lang, J. Linn, M. Arnold  
**Multibody dynamics simulation of geometrically exact Cosserat rods**  
Keywords: flexible multibody dynamics, large deformations, finite rotations, constrained mechanical systems, structural dynamics  
(20 pages, 2009)
160. P. Jung, S. Leyendecker, J. Linn, M. Ortiz  
**Discrete Lagrangian mechanics and geometrically exact Cosserat rods**  
Keywords: special Cosserat rods, Lagrangian mechanics, Noether's theorem, discrete mechanics, frame-indifference, holonomic constraints  
(14 pages, 2009)
161. M. Burger, K. Dreßler, A. Marquardt, M. Speckert  
**Calculating invariant loads for system simulation in vehicle engineering**  
Keywords: iterative learning control, optimal control theory, differential algebraic equations (DAEs)  
(18 pages, 2009)
162. M. Speckert, N. Ruf, K. Dreßler  
**Undesired drift of multibody models excited by measured accelerations or forces**  
Keywords: multibody simulation, full vehicle model, force-based simulation, drift due to noise  
(19 pages, 2009)
163. A. Streit, K. Dreßler, M. Speckert, J. Lichten, T. Zenner, P. Bach  
**Anwendung statistischer Methoden zur Erstellung von Nutzungsprofilen für die Auslegung von Mobilbaggern**  
Keywords: Nutzungsvielfalt, Kundenbeanspruchung, Bemessungsgrundlagen  
(13 pages, 2009)
164. I. Correia, S. Nickel, F. Saldanha-da-Gama  
**The capacitated single-allocation hub location problem revisited: A note on a classical formulation**  
Keywords: Capacitated Hub Location, MIP formulations  
(10 pages, 2009)
165. F. Yaneva, T. Grebe, A. Scherrer  
**An alternative view on global radiotherapy optimization problems**  
Keywords: radiotherapy planning, path-connected sublevelsets, modified gradient projection method, improving and feasible directions  
(14 pages, 2009)
166. J. I. Serna, M. Monz, K.-H. Küfer, C. Thieke  
**Trade-off bounds and their effect in multi-criteria IMRT planning**  
Keywords: trade-off bounds, multi-criteria optimization, IMRT, Pareto surface  
(15 pages, 2009)
167. W. Arne, N. Marheineke, A. Meister, R. Wegener  
**Numerical analysis of Cosserat rod and string models for viscous jets in rotational spinning processes**  
Keywords: Rotational spinning process, curved viscous fibers, asymptotic Cosserat models, boundary value problem, existence of numerical solutions  
(18 pages, 2009)
168. T. Melo, S. Nickel, F. Saldanha-da-Gama  
**An LP-rounding heuristic to solve a multi-period facility relocation problem**  
Keywords: supply chain design, heuristic, linear programming, rounding  
(37 pages, 2009)
169. I. Correia, S. Nickel, F. Saldanha-da-Gama  
**Single-allocation hub location problems with capacity choices**  
Keywords: hub location, capacity decisions, MILP formulations  
(27 pages, 2009)
170. S. Acar, K. Natcheva-Acar  
**A guide on the implementation of the Heath-Jarrow-Morton Two-Factor Gaussian Short Rate Model (HJM-G2++)**  
Keywords: short rate model, two factor Gaussian, G2++, option pricing, calibration  
(30 pages, 2009)
171. A. Szimayer, G. Dimitroff, S. Lorenz  
**A parsimonious multi-asset Heston model: calibration and derivative pricing**  
Keywords: Heston model, multi-asset, option pricing, calibration, correlation  
(28 pages, 2009)
172. N. Marheineke, R. Wegener  
**Modeling and validation of a stochastic drag for fibers in turbulent flows**  
Keywords: fiber-fluid interactions, long slender fibers, turbulence modelling, aerodynamic drag, dimensional analysis, data interpolation, stochastic partial differential algebraic equation, numerical simulations, experimental validations  
(19 pages, 2009)
173. S. Nickel, M. Schröder, J. Steeg  
**Planning for home health care services**  
Keywords: home health care, route planning, meta-heuristics, constraint programming  
(23 pages, 2009)
174. G. Dimitroff, A. Szimayer, A. Wagner  
**Quanto option pricing in the parsimonious Heston model**  
Keywords: Heston model, multi asset, quanto options, option pricing  
(14 pages, 2009)

175. S. Herkt, K. Dreßler, R. Pinnau  
**Model reduction of nonlinear problems in structural mechanics**  
Keywords: flexible bodies, FEM, nonlinear model reduction, POD  
(13 pages, 2009)
176. M. K. Ahmad, S. Didas, J. Iqbal  
**Using the Sharp Operator for edge detection and nonlinear diffusion**  
Keywords: maximal function, sharp function, image processing, edge detection, nonlinear diffusion  
(17 pages, 2009)
177. M. Speckert, N. Ruf, K. Dreßler, R. Müller, C. Weber, S. Weihe  
**Ein neuer Ansatz zur Ermittlung von Erprobungslasten für sicherheitsrelevante Bauteile**  
Keywords: sicherheitsrelevante Bauteile, Kundenbeanspruchung, Festigkeitsverteilung, Ausfallwahrscheinlichkeit, Konfidenz, statistische Unsicherheit, Sicherheitsfaktoren  
(16 pages, 2009)
178. J. Jegorovs  
**Wave based method: new applicability areas**  
Keywords: Elliptic boundary value problems, inhomogeneous Helmholtz type differential equations in bounded domains, numerical methods, wave based method, uniform B-splines  
(10 pages, 2009)
179. H. Lang, M. Arnold  
**Numerical aspects in the dynamic simulation of geometrically exact rods**  
Keywords: Kirchhoff and Cosserat rods, geometrically exact rods, deformable bodies, multibody dynamics, partial differential algebraic equations, method of lines, time integration  
(21 pages, 2009)
180. H. Lang  
**Comparison of quaternionic and rotation-free null space formalisms for multibody dynamics**  
Keywords: Parametrisation of rotations, differential-algebraic equations, multibody dynamics, constrained mechanical systems, Lagrangian mechanics  
(40 pages, 2010)
181. S. Nickel, F. Saldanha-da-Gama, H.-P. Ziegler  
**Stochastic programming approaches for risk aware supply chain network design problems**  
Keywords: Supply Chain Management, multi-stage stochastic programming, financial decisions, risk  
(37 pages, 2010)
182. P. Ruckdeschel, N. Horbenko  
**Robustness properties of estimators in generalized Pareto Models**  
Keywords: global robustness, local robustness, finite sample breakdown point, generalized Pareto distribution  
(58 pages, 2010)
183. P. Jung, S. Leyendecker, J. Linn, M. Ortiz  
**A discrete mechanics approach to Cosserat rod theory – Part 1: static equilibria**  
Keywords: Special Cosserat rods; Lagrangian mechanics; Noether's theorem; discrete mechanics; frame-indifference; holonomic constraints; variational formulation  
(35 pages, 2010)
184. R. Eymard, G. Printypar  
**A proof of convergence of a finite volume scheme for modified steady Richards' equation describing transport processes in the pressing section of a paper machine**  
Keywords: flow in porous media, steady Richards' equation, finite volume methods, convergence of approximate solution  
(14 pages, 2010)
185. P. Ruckdeschel  
**Optimally Robust Kalman Filtering**  
Keywords: robustness, Kalman Filter, innovation outlier, additive outlier  
(42 pages, 2010)
186. S. Repke, N. Marheineke, R. Pinnau  
**On adjoint-based optimization of a free surface Stokes flow**  
Keywords: film casting process, thin films, free surface Stokes flow, optimal control, Lagrange formalism  
(13 pages, 2010)
187. O. Iliev, R. Lazarov, J. Willems  
**Variational multiscale Finite Element Method for flows in highly porous media**  
Keywords: numerical upscaling, flow in heterogeneous porous media, Brinkman equations, Darcy's law, subgrid approximation, discontinuous Galerkin mixed FEM  
(21 pages, 2010)
188. S. Desmettre, A. Szimayer  
**Work effort, consumption, and portfolio selection: When the occupational choice matters**  
Keywords: portfolio choice, work effort, consumption, occupational choice  
(34 pages, 2010)
189. O. Iliev, Z. Lakdawala, V. Starikovicius  
**On a numerical subgrid upscaling algorithm for Stokes-Brinkman equations**  
Keywords: Stokes-Brinkman equations, subgrid approach, multiscale problems, numerical upscaling  
(27 pages, 2010)
190. A. Latz, J. Zausch, O. Iliev  
**Modeling of species and charge transport in Li-Ion Batteries based on non-equilibrium thermodynamics**  
Keywords: lithium-ion battery, battery modeling, electrochemical simulation, concentrated electrolyte, ion transport  
(8 pages, 2010)
191. P. Popov, Y. Vutov, S. Margenov, O. Iliev  
**Finite volume discretization of equations describing nonlinear diffusion in Li-Ion batteries**  
Keywords: nonlinear diffusion, finite volume discretization, Newton method, Li-Ion batteries  
(9 pages, 2010)
192. W. Arne, N. Marheineke, R. Wegener  
**Asymptotic transition from Cosserat rod to string models for curved viscous inertial jets**  
Keywords: rotational spinning processes; inertial and viscous-inertial fiber regimes; asymptotic limits; slender-body theory; boundary value problems  
(23 pages, 2010)
193. L. Engelhardt, M. Burger, G. Bitsch  
**Real-time simulation of multibody-systems for on-board applications**  
Keywords: multibody system simulation, real-time simulation, on-board simulation, Rosenbrock methods  
(10 pages, 2010)
194. M. Burger, M. Speckert, K. Dreßler  
**Optimal control methods for the calculation of invariant excitation signals for multibody systems**  
Keywords: optimal control, optimization, mbs simulation, invariant excitation  
(9 pages, 2010)
195. A. Latz, J. Zausch  
**Thermodynamic consistent transport theory of Li-Ion batteries**  
Keywords: Li-Ion batteries, nonequilibrium thermodynamics, thermal transport, modeling  
(18 pages, 2010)
196. S. Desmettre  
**Optimal investment for executive stockholders with exponential utility**  
Keywords: portfolio choice, executive stockholder, work effort, exponential utility  
(24 pages, 2010)
197. W. Arne, N. Marheineke, J. Schnebele, R. Wegener  
**Fluid-fiber-interactions in rotational spinning process of glass wool production**  
Keywords: Rotational spinning process, viscous thermal jets, fluid-fiber-interactions, two-way coupling, slender-body theory, Cosserat rods, drag models, boundary value problem, continuation method  
(20 pages, 2010)
198. A. Klar, J. Maringer, R. Wegener  
**A 3d model for fiber lay-down in nonwoven production processes**  
Keywords: fiber dynamics, Fokker-Planck equations, diffusion limits  
(15 pages, 2010)
199. Ch. Erlwein, M. Müller  
**A regime-switching regression model for hedge funds**  
Keywords: switching regression model, Hedge funds, optimal parameter estimation, filtering  
(26 pages, 2011)
200. M. Dalheimer  
**Power to the people – Das Stromnetz der Zukunft**  
Keywords: Smart Grid, Stromnetz, Erneuerbare Energien, Demand-Side Management  
(27 pages, 2011)
201. D. Stahl, J. Hauth  
**PF-MPC: Particle Filter-Model Predictive Control**  
Keywords: Model Predictive Control, Particle Filter, CSTR, Inverted Pendulum, Nonlinear Systems, Sequential Monte Carlo  
(40 pages, 2011)
202. G. Dimitroff, J. de Kock  
**Calibrating and completing the volatility cube in the SABR Model**  
Keywords: stochastic volatility, SABR, volatility cube, swaption  
(12 pages, 2011)
203. J.-P. Kreiss, T. Zangmeister  
**Quantification of the effectiveness of a safety function in passenger vehicles on the basis of real-world accident data**  
Keywords: logistic regression, safety function, real-world accident data, statistical modeling  
(23 pages, 2011)

204. P. Ruckdeschel, T. Sayer, A. Szimayer  
**Pricing American options in the Heston model: a close look on incorporating correlation**  
Keywords: Heston model, American options, moment matching, correlation, tree method (30 pages, 2011)
205. H. Ackermann, H. Ewe, K.-H. Küfer, M. Schröder  
**Modeling profit sharing in combinatorial exchanges by network flows**  
Keywords: Algorithmic game theory, profit sharing, combinatorial exchange, network flows, budget balance, core (17 pages, 2011)
206. O. Iliev, G. Printsypar, S. Rief  
**A one-dimensional model of the pressing section of a paper machine including dynamic capillary effects**  
Keywords: steady modified Richards' equation, finite volume method, dynamic capillary pressure, pressing section of a paper machine (29 pages, 2011)
207. I. Vecchio, K. Schladitz, M. Godehardt, M. J. Heneka  
**Geometric characterization of particles in 3d with an application to technical cleanliness**  
Keywords: intrinsic volumes, isoperimetric shape factors, bounding box, elongation, geodesic distance, technical cleanliness (21 pages, 2011)
208. M. Burger, K. Dreßler, M. Speckert  
**Invariant input loads for full vehicle multibody system simulation**  
Keywords: multibody systems, full-vehicle simulation, optimal control (8 pages, 2011)
209. H. Lang, J. Linn, M. Arnold  
**Multibody dynamics simulation of geometrically exact Cosserat rods**  
Keywords: flexible multibody dynamics, large deformations, finite rotations, constrained mechanical systems, structural dynamics (28 pages, 2011)
210. G. Printsypar, R. Ciegis  
**On convergence of a discrete problem describing transport processes in the pressing section of a paper machine including dynamic capillary effects: one-dimensional case**  
Keywords: saturated and unsaturated fluid flow in porous media, Richards' approach, dynamic capillary pressure, finite volume methods, convergence of approximate solution (24 pages, 2011)
211. O. Iliev, G. Printsypar, S. Rief  
**A two-dimensional model of the pressing section of a paper machine including dynamic capillary effects**  
Keywords: two-phase flow in porous media, steady modified Richards' equation, finite volume method, dynamic capillary pressure, pressing section of a paper machine, multipoint flux approximation (44 pages, 2012)
212. M. Buck, O. Iliev, H. Andrä  
**Multiscale finite element coarse spaces for the analysis of linear elastic composites**  
Keywords: linear elasticity, domain decomposition, multiscale finite elements, robust coarse spaces, rigid body modes, discontinuous coefficients (31 pages, 2012)
213. A. Wagner  
**Residual demand modeling and application to electricity pricing**  
Keywords: residual demand modeling, renewable infeed, wind infeed, solar infeed, electricity demand, German power market, merit-order effect (28 pages, 2012)
214. O. Iliev, A. Latz, J. Zausch, S. Zhang  
**An overview on the usage of some model reduction approaches for simulations of Li-ion transport in batteries**  
Keywords: Li-ion batteries, porous electrode model, model reduction (21 pages, 2012)
215. C. Zémerli, A. Latz, H. Andrä  
**Constitutive models for static granular systems and focus to the Jiang-Liu hyperelastic law**  
Keywords: granular elasticity, constitutive modelling, non-linear finite element method (33 pages, 2012)
216. T. Gornak, J. L. Guermond, O. Iliev, P. D. Minev  
**A direction splitting approach for incompressible Brinkmann flow**  
Keywords: unsteady Navier-Stokes-Brinkman equations, direction splitting algorithms, nuclear reactors safety simulations (16 pages, 2012)
217. Y. Efendiev, O. Iliev, C. Kronsbein  
**Multilevel Monte Carlo methods using ensemble level mixed MsFEM for two-phase flow and transport simulations**  
Keywords: two phase flow in porous media, uncertainty quantification, multilevel Monte Carlo (28 pages, 2012)
218. J. Linn, H. Lang, A. Tuganov  
**Geometrically exact Cosserat rods with Kelvin-Voigt type viscous damping**  
Keywords: geometrically exact rods, viscous damping, Kelvin-Voigt model, material damping parameters (10 pages, 2012)
219. M. Schulze, S. Dietz, J. Linn, H. Lang, A. Tuganov  
**Integration of nonlinear models of flexible body deformation in Multibody System Dynamics**  
Keywords: multibody system dynamics, flexible structures, discrete Cosserat rods, wind turbine rotor blades (10 pages, 2012)
220. C. Weischedel, A. Tuganov, T. Hermansson, J. Linn, M. Wardetzky  
**Construction of discrete shell models by geometric finite differences**  
Keywords: geometrically exact shells, discrete differential geometry, rotation-free Kirchhoff model, triangular meshes (10 pages, 2012)
221. M. Taralov, V. Taralova, P. Popov, O. Iliev, A. Latz, J. Zausch  
**Report on Finite Element Simulations of Electrochemical Processes in Li-ion Batteries with Thermic Effects**  
Keywords: Li-ion battery, FEM for nonlinear problems, FEM for discontinuous solutions, Nonlinear diffusion, Nonlinear interface conditions (40 pages, 2012)
222. A. Scherrer, T. Grebe, F. Yaneva, K.-H. Küfer  
**Interactive DVH-based planning of intensity-modulated radiation therapy (IMRT)**  
Keywords: intensity-modulated radiation therapy (IMRT), cumulative dose-volume histogram (DVH), interactive IMRT planning, DVH-based planning criteria (22 pages, 2012)
223. S. Frei, H. Andrä, R. Pinnau, O. Tse  
**An adjoint-based gradient-type algorithm for optimal fiber orientation in fiber-reinforced materials**  
Keywords: pde constrained optimization, fiber-reinforced materials, fiber orientation, linear elasticity, upscaling, adjoint-based optimization, microstructural optimization (17 pages, 2012)
224. M. Kabel, H. Andrä  
**Fast numerical computation of precise bounds of effective elastic moduli**  
Keywords: composite materials, numerical homogenization, effective elasticity coefficients, Hashin-Shtrikman bounds, Lippmann-Schwinger equation, FFT (16 pages, 2013)
225. J. Linn, H. Lang, A. Tuganov  
**Derivation of a viscoelastic constitutive model of Kelvin-Voigt type for Cosserat rods**  
Keywords: geometrically exact rods, viscoelasticity, Kelvin-Voigt model, nonlinear structural dynamics (42 pages, 2013)
226. H. Knaf  
**Distanzen zwischen Partitionen – zur Anwendung und Theorie**  
Keywords: Metrik, Partitionenverband, Clusteranalyse, Ergebnisbewertung (35 pages, 2013)
227. S. Desmettre, R. Korn, F. Th. Seifried  
**Worst-case consumption-portfolio optimization**  
Keywords: worst-case, crash, consumption, verification (30 pages, 2013)
228. M. Obermayr, Ch. Vrettos, J. Kleinert, P. Eberhard  
**A Discrete Element Method for assessing reaction forces in excavation tools**  
Keywords: discrete element method, rolling resistance, cohesionless soil, draft force (17 pages, 2013)
229. S. Schmidt, L. Kreußner, S. Zhang  
**POD-DEIM based model order reduction for a three-dimensional microscopic Li-Ion battery model**  
Keywords: Model order reduction, nonlinear PDE, POD-DEIM, Li-Ion battery simulation (33 pages, 2013)
230. Y. Efendiev, O. Iliev, V. Taralova  
**Upscaling of an isothermal Li-ion battery model via the Homogenization Theory**  
Keywords: Li-Ion batteries, homogenization (66 pages, 2013)
231. D. Neusius, S. Schmidt;  
**A Cartesian cut-cell method for the isothermal compressible viscous Navier-Stokes Equations**  
Keywords: Immersed boundary methods, Cartesian cut-cell method, Finite-volume method, Compressible Navier-Stokes equations (35 pages, 2013)

232. S. Desmettre, R. Korn, P. Ruckdeschel, F. Th. Seifried

**Robust worst-case optimal investment**

Keywords: worst-case, crash scenario, robust optimization, Knightian uncertainty, efficiency, min-max approach (24 pages, 2013)

233. A. Scherrer, P. Rüdiger, A. Dinges, K.-H. Küfer, I. Schwidde, S. Kümmel

**A decision support system for advanced treatment planning for breast cancer**

Keywords: breast cancer therapy, disease modeling, mathematical decision making, decision support systems (7 pages, 2013)

234. A. Hoffmann A. Scherrer, K.-H. Küfer

**Analyzing the quality robustness of chemotherapy plans with respect to model uncertainties**

Keywords: chemotherapy planning, ordinary differential equations, nonlinear optimization, multi-criteria decision making, sensitivity analysis, elasticity analysis (20 pages, 2013)

235. T. Gornak

**A goal oriented survey on immersed boundary methods**

Keywords: immersed boundary method, survey, fictitious domain method, containment pool simulation (23 pages, 2013)

236. T. Gornak, P. Minev, A. Zemitis

**On a fast algorithm and software for 3D simulation of thermal stratification in containment pools of nuclear power plants**

Keywords: Navier-Stokes equations, thermal convection (fluid dynamics), heat conduction, numerical methods, domain decomposition method, nuclear reactors safety (15 pages, 2013)

237. A. Scherrer, I. Schwidde, A. Dinges, P. Rüdiger, S. Kümmel, K.-H. Küfer

**Breast cancer therapy planning – a sequential decision making problem**

Keywords: breast cancer therapy planning, sequential decision making, mathematical decision support (17 pages, 2013)

238. J. Kleinert, M. Obermayr, M. Balzer

**Modeling of large scale granular systems using the Discrete Element Method and the Non-Smooth Contact Dynamics Method: A comparison**

Keywords: DEM, granular material, complementarity systems, non-smooth contact dynamics (10 pages, 2013)

239. H. Lang, S. Leyendecker, J. Linn

**Numerical experiments for viscoelastic Cosserat rods with Kelvin-Voigt damping**

Keywords: Flexible multibody dynamics, geometrically exact rods, Kelvin-Voigt damping, viscoelasticity (10 pages, 2013)

240. M. Roller, P. Betsch, A. Gallrein, J. Linn

**On the use of geometrically exact shells for dynamic tire simulation**

Keywords: geometrically exact shell, multibody dynamics, large rotations, dynamical contact, tire simulation (10 pages, 2013)

241. O. Iliev, Y. Maday, T. Nagapetyan

**A two-grid infinite-volume/reduced basis scheme for the approximation of the solution of parameter dependent PDE with applications to AFFF Devices**

Keywords: asymmetric flow field flow fractionation, mean exit time, finite volume, reduced basis (14 pages, 2014)

242. M. Kleer, A. Gizatullin, K. Dreßler, S. Müller

**Real-time human in the loop MBS simulation in the Fraunhofer Robot-Based Driving Simulator**

Keywords: Driving simulator; human in the loop; real-time MBS simulation (14 pages, 2014)

243. O. Bauchau, Z. Lao, M. Lyu, S. Brändle, J. Linn

**Formulations of viscoelastic constitutive laws for beams in flexible multibody dynamics**

Keywords: geometrically exact rods, viscoelastic materials, generalized Maxwell model, flexible multibody dynamics (12 pages, 2014)

244. J. Kleinert, B. Simeon, M. Obermayr

**An inexact Interior Point Method for the simulation of large scale granular systems**

Keywords: Non-smooth dynamical systems, granular material, cone complementarity problem, symmetric cones, Interior Point Method, Jordan Algebra (21 pages, 2014)

**Status quo: July 2014**
