Global Tech Mining Conference, 17.11.2021

Representing the research landscape of CE

Why we started:

Circular economy (CE) is one way to support transition towards a more sustainable future.

Need to identify technologies that support this transition.

(Ena et al. 2016)

How can we contribute to this with data driven / tech mining methods?

What is needed to enable researchers, managers and policy makers to identify such technologies?

Research aim:

Representing the research landscape of CE

- Identify scientific knowledge fields
- Track scientific knowledge fields over time

Find continuous research streams → may be the “drivers”

Identify new scientific knowledge elements and fields

The basis of our research

Definitions:

Research landscape consists of different scientific knowledge fields, evolving over time.

Scientific knowledge field is union of **scientific knowledge elements**, which are information embedded in a scientific article.

(Zhang et al. 2020)

CE:

- Minimizing waste generation and material inputs
- Maintaining value of products and resources
- Eco-design,
- Sharing, repairing, refurbishing,
- Recycling and reusing of products.

(Wijkman and Skanberg; 2015; Merli et al. 2018)

Finding research streams and new scientific knowledge elements and fields

Search query in
Dimensions database

Basic facts:

Query: “circular economy”

(Geissdoerfer et al., 2017)

8,447 publications since 2010

CE has a higher growth rate
than the Dimensions database
as of 2013

SciBERT

Because of its nutritious properties the black soldier fly has emerged as one of the most popular species in advancing circular economy through the re-valorization of anthropogenic organic wastes to insect biomass.

Finding research streams and new scientific knowledge elements and fields

Continuous research streams in CE research

Wastewater treatment,
anaerobic digestion,
solid waste

Knowledge elements:
commercial fertilizer, hydrothermal
carbonization, enzymatic hydrolysis,
biorefinery, microalgae biomass

Suitability of **Black Soldier Fly** Frass as Soil Amendment and Implication for Organic Waste Hygienization

Show Details

/2020

Because of its nutritious properties, the black soldier fly has emerged as one of the most popular species in advancing **circular economy** through the re-valorization of anthropogenic organic wastes to insect biomass. Black soldier fly frass accumulates as a major by-product in artificial rearing set-ups and harbors great potential to complement or replace **commercial fertilizers**.

Cluster from 2020+2021:

Construction industry, food
industry, textile industry,
secondary raw material

Knowledge elements:

green solvent, bituminous mixture, asphalt
mixture, polymeric material, black soldier fly,
functional food

Remediation of petroleum contaminated saline water using value-added adsorbents
derived from waste coconut fibres

Show Details

/2021

[...] Therefore, this study aims at developing an technique that uses waste coconut fibres (*Cocos nucifera* L.) pre-treated with a "green" solvent, viz. protic ionic liquid (PIL) [2-HEA][Ac], for the remediation of oil in saline water. [...] Therefore, the use of these petroleum biosorbents is a technology with environmental benefits, such as the availability of the biosorbent in the form of biodegradable waste and treated with a "green" solvent, both of which can be reused. Thus, it adds value for its use in industries with a circular economy product; that are environment-friendly and economical.

Conclusions:

- Approach allows to identify research streams
- Approach allows to identify new scientific knowledge elements and fields
- Noun phrase / information extraction still needs further improvements!

What's your experience on information extraction from scientific articles?

Limitations:

- Design decisions e.g. cluster labelling, different thresholds,...
- Need for extended stopwords list

Future work:

- Expert evaluation
- Improving information extraction
- Measure degree of interdisciplinarity
