ISSUE

The collection of chaff during harvesting opens a new biomass potential for energetic usage. The efficient logistic of chaff is in conflict with its low bulk density. Pelletizing chaff can overcome this issue and was evaluated.

QUESTIONS

Is pre-treatment prior to pelletizing necessary? Chaff consists mainly of husks and straw. Pre-sieving chaff to sort out straw avoids milling and improves combustion properties.

FROM HARVEST TO PELLETS

Harvest Collection of chaff

Pre-sieving

What are optimized pelletizing conditions?

Experiments evaluated the pelletizability of chaff.

| Varied parameters | |
|--------------------------|--------------|
| Moisture content | 8 – 28 wt.% |
| Starch as a binder | 1 and 2 wt.% |
| l/d – ratio of die bores | 4 and 5 |

How good are the produced pellets?

- High durability
- High bulk density
- Moisture content of < 10 wt.%</p>

SUMMARY

Wheat chaff can be pelletized without the addition of binder. With the correct pelletizing parameters, the resulting pellets have characteristics, which are <u>in</u> <u>accordance with the ENPlus standards</u> and can be used as biofuel. Mesh size: 10 mm Fine fraction \triangleq 80 wt.%

Bore dimensions:

l/d = 5

Adjusting water content to 20 wt.%

Chaff pellets

- Bulk density: 680 kg/m³
 Durability: 98.6 %
- Moisture content: 9.3 wt.%

Proposed process chain from the harvest to optimized biofuel pellets
